

THE CHALLENGE

ÉCLAT

The Movement Guide

Volume 01 · Twelve weeks to take back your body, your energy and your confidence.

You are not repairing
something broken.
You are simply coming back
to live in your body.

DAY ZERO

WHAT YOU'LL FIND IN HERE

Contents

- Before you begin — A letter for you — 04
- How to use it — Reading this guide — 05
- The contract — Your commitment, in writing — 06
- The spirit of the challenge — A mood board — 07
01 Setting the intention — The why before the how — 08
02 Understanding your body — The four pillars, the cycle, intensity — 16
- The subject nobody mentions — Pelvic floor and abdominal wall — 21
03 The programme — Twelve weeks, three blocks — 22
- Block 01 · Foundations — Weeks 1 to 4 — 26
- Block 02 · Building — Weeks 5 to 8 — 30
- Block 03 · Éclat — Weeks 9 to 12 — 34
- Progressing — The +1 rule and life after day 90 — 38
04 Exercise library — Thirty-five cards: cues and mistakes to avoid — 40
05 Mobility & recovery — What happens between sessions — 48
06 Lasting 90 days — What separates trying from finishing — 52
- When life gets in the way — Adapting without abandoning — 55
- The questions I get asked — Eight short answers — 56
07 The logbook — Tracker, weekly sheets and reviews — 57
- The ninetieth day — One last letter — 63

Pages marked with a nude dot are pages to fill in.
Keep a pen beside you.

BEFORE YOU BEGIN

If you're reading this, it has already begun.

You've almost certainly tried before. A membership bought in January, three sessions, then life taking over again. An app downloaded, a programme found online, two weeks held, then silence. And every time, that small voice: *"I'm just not a disciplined person."*

Let me tell you something: this isn't a discipline problem. It's a **design** problem. The programmes you tried were built for a body that isn't yours, a life that isn't yours, and a level of motivation nobody has twelve months a year.

This one is different on three counts.

It starts from your why, not from a number. Before the first session you'll spend twenty minutes writing down what you actually want. Not a weight. A feeling: getting up without that heavy tiredness, climbing four flights without gasping, wearing that dress again, daring to be in a photo. That is what holds on a rainy Tuesday evening.

It's built to be kept, not to be perfect. Four sessions a week, two of them thirty minutes. Every exercise has a home version and a gym version. And when a week falls apart, you have a ten-minute plan B that counts just as much.

It grows with you. Twelve weeks, three blocks. What you'll do in week 10 would be discouraging in week 1 - and easy once you get there.

12	04	35 min	00
weeks, in three blocks of rising difficulty	sessions a week, two of them short	on average per session, warm-up included	equipment needed for the home version

THE ONLY COMMITMENT

You don't have to believe in it today. You just have to open this guide four times this week. Confidence doesn't come before action - it comes after, and it comes from repeated action. That is the whole point of these 90 days.

How to use this guide

01 **Read parts 1 and 2 in one sitting**

Thirty minutes, a coffee, a pen. You set your goals and you understand what you'll be working on. Don't skip the pages to fill in: those are the ones you'll reread in week 7, when it gets hard.

02 **Choose your ground: home or gym**

Every session comes in both versions, side by side in the same table. You can change your mind along the way and switch from one to the other week by week. The programme stays the same.

03 **Print the logbook pages**

The 90-day tracker, the weekly sheets and the day 30 / 60 / 90 reviews are at the back of the guide. Print them, or copy them into a notebook. What gets measured gets kept.

04 **Put your four sessions in your calendar**

Now, not next Sunday. With a start time and an end time, like any appointment. A session that isn't in the calendar is a session that won't happen.

05 **Start the following Monday**

Not today if you're not ready, but not in three weeks either. A start that is dated, written down, and told to someone.

BEFORE YOU START - THE HEALTH CHECK

This guide is a general fitness programme, not medical advice. Talk to your doctor before starting if you are pregnant or postpartum, if you have a cardiac, joint or chronic condition, if you are coming back from an injury or an operation, or if you are restarting after more than two years off. Sharp pain, joint pain or pain that radiates is never "normal": you stop and you get it checked. Diffuse soreness 24 to 48 hours after a session, on the other hand, is expected.

One test to do before block 2, whatever your profile: the pelvic floor check on page 21. It takes thirty seconds and it shapes how you'll approach heavy loads and jumping.

TO BE SIGNED BEFORE SESSION 1

The contract

Not a performance contract. An attendance contract. Reread it on the day you want to quit - and you will, probably around week three.

I,

- I commit to **90 days**, not to a result. The result will come, but it isn't what I'm promising.
- I commit to **four appointments a week** with myself - three strength sessions and one cardio - written into my calendar.
- I commit to **never missing two sessions in a row**. One skipped session happens. Two is a habit coming undone.
- I commit to measuring my progress **by something other than the scale**: energy, strength, sleep, mood, posture.
- I commit to speaking to myself **the way I would speak to my dearest friend**. No insults, no "I should have", no using exercise as punishment.
- I commit to **starting again** as many times as it takes, without going back to zero.

I START ON

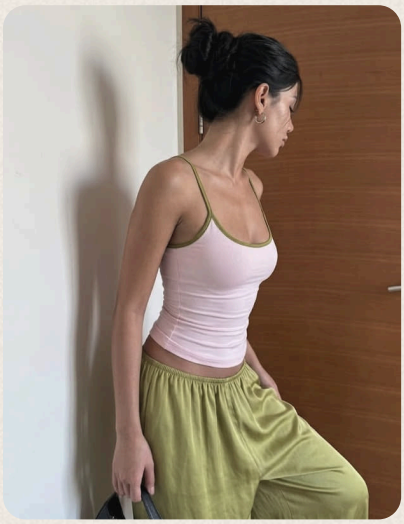

SIGNATURE

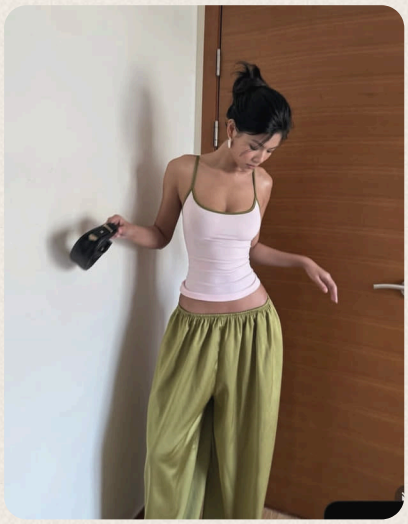

"I don't motivate myself. I schedule myself."

THE SPIRIT OF THE CHALLENGE

What these 90 days actually look like

No noisy gym, no blaring timer, no before-and-after. Clothes laid out the night before, morning light, a notebook you write in, and the same hour every week.

THE RHYTHM

Four appointments a week, in the calendar like any other.

THE PLACE

A mat in a hallway, or a gym. Both versions are in this guide.

THE KIT

Nothing compulsory. A resistance band and two light dumbbells if you want to go further.

THE PROOF

A logbook filled in by hand. That's all we'll look at on day 90.

01

Setting the intention

Nobody holds on for three months for a number on a scale. You hold on for a feeling you want back.

- The power of why, and the three-circle method
- Writing three goals you can keep - the CLEAR method
- Measuring differently: the seven markers of glow
- Your starting point, written down in black and white

Why your "why" changes everything

Motivation is an emotion. Like every emotion it comes and goes - and it is absent precisely on the days you would need it. Relying on it is building on sand.

What remains once motivation has gone is a **reason**. A reason stands on its own, on a rainy Tuesday evening, after a bad day. But it has to be yours.

"Losing 5 kilos" is almost never a real reason. It's a translation. Behind it is something else: feeling light going up stairs, no longer avoiding photos, wearing again a piece of clothing pushed to the back of the wardrobe, being less out of breath playing with your children, waking up without back pain.

Those things can be had without the scale. And when you aim at them directly you often reach the number too - without having made it an obsession.

THE THREE-CIRCLE EXERCISE

Your real why sits where three questions overlap. Take them in order, without worrying about what is "realistic".

01 **Feel**
In 90 days, how do I want to *feel* in my body? Look for adjectives, not numbers. Light? Strong? Grounded? Rested?

02 **Do**
What do I want to be *able* to do that I can't do today? One precise, verifiable action.

03 **Become**
Which woman do I want to be in 90 days? Describe her in the third person, as if you were talking about a friend you admire.

THE TUESDAY-EVENING TEST

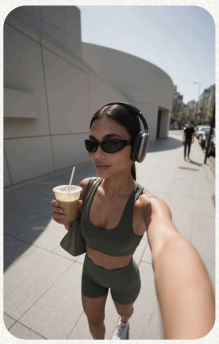

Reread your reason and ask: would this get my trainers on at 7 pm on a Tuesday when I don't feel like it at all? If the answer is no, dig further.

THE NOBODY-WATCHING TEST

If nobody could see the result - not your partner, not Instagram, not your mother-in-law - would you still want it? Whatever survives that question is your real engine.

THE FIVE-WHYS TEST

Write your reason down, then ask "why?" five times in a row. By the fifth you touch something true - and often unexpected.

WORKSHOP · TO FILL IN

My why

Write by hand, in full sentences, without rereading. Ten minutes. Nobody will read this page.

01 · FEEL - IN 90 DAYS, I WANT TO FEEL…

02 · DO - I WANT TO BE ABLE TO…

03 · BECOME - IN 90 DAYS, SHE IS…

THE HEART OF IT - MY REASON, IN ONE SENTENCE

The one you'll reread on the days you don't feel like it.

NEXT

Copy that sentence somewhere you'll see it: phone wallpaper, bathroom mirror, first page of your notebook. Not to motivate you - to remind you.

Turning a wish into a goal you can keep

A wish is "I want to get back into exercise". A goal is something you can say yes or no to on day 90. The difference fits into five letters.

- **C - Concrete.** Observable from outside. "Being fit" isn't. "Holding a 90-second plank" is.
- **L - Linked to you.** Written from your own desire, not from a comparison. If the goal contains somebody else's name, rewrite it.
- **E - Earned in 90 days.** Ambitious but credible. Simple rule: if you doubt you could reach it even doing everything right, it's too much. If you're certain you'd reach it effortlessly, it's too little.
- **A - Anchored to a date.** With a checkpoint: day 30, day 60, day 90.
- **R - Reviewable.** A goal adjusted along the way isn't a failure, it's a living goal. The only real failure is to stop looking at it. And at least two of your three goals should have nothing to do with weight or size.
- **The rule behind the rules.** A goal you can only measure on the scale is a goal that will discourage you for eight weeks out of twelve.

VAGUE

"I want to lose weight and get more toned."

CLEAR

"On day 90, I do 10 push-ups from my knees in a row, I climb my 4 flights without stopping, and my black jeans fit comfortably again."

THREE FAMILIES OF GOALS

Performance - what your body can do. Push-ups, plank, squats, load lifted, minutes of running.

Sensation - how you live inside your body. Energy, sleep, aches, breath, mood.

Appearance - what you see. A garment, a photo, a measurement. Legitimate, but one goal out of three at most: it's the slowest to move and the most discouraging if it's all you look at.

ABOUT THE SCALE

If you want to weigh yourself, do it once a week, same day, on waking, and look only at the **monthly average**. Weight swings by 1 to 2 kg within 24 hours depending on hydration, your cycle, salt and digestion: a single reading teaches you nothing, it only ruins your day.

WORKSHOP · TO FILL IN

My three goals

One performance, one sensation, one free. Write them in the present tense, as if already achieved on day 90.

GOAL 01 · PERFORMANCE

WHAT MY BODY WILL BE ABLE TO DO

Where I am today

How I'll check it

GOAL 02 · SENSATION

HOW I'LL LIVE INSIDE MY BODY

Where I am today

How I'll check it

GOAL 03 · FREE CHOICE

THE ONE THAT BELONGS TO ME ALONE

Where I am today

How I'll check it

Checkpoints: **D30** —— · **D60** —— · **D90** ——
Write all three dates in your calendar now.

The seven markers of glow

Your body will change well before the scale does. The trouble is that those changes are invisible unless you write them down. Here is what we actually measure over these 90 days.

01 - Morning energy

The first marker to move, often as early as week three. You wake before the alarm, or you get up without the feeling of dragging your body around.

02 - Sleep

Falling asleep faster, waking less at night. Regular physical activity is one of the strongest levers on sleep quality - stronger than most supplements.

03 - Strength

The most satisfying marker because it's countable: the number of reps, the seconds of plank, the kilos on the bar. It climbs fast over the first six weeks.

04 - Breath

Not "running faster", but *recovering* faster. Climbing three flights and still being able to talk at the top. That's the sign of a heart working better.

05 - Posture & back

Shoulders dropping back down, less pulling in the lower back at the end of the day, a looser neck. Back and core work pays off here first.

06 - Mood

Less reactivity to stress, less rumination in the evening. Thirty minutes of moderate effort has a measurable effect on anxiety, the same day.

07 - Confidence

The slowest and the most important. It doesn't come from the result but from keeping your word: with every session done, you prove to yourself that you do what you say. That is the glow.

WHAT ABOUT MEASUREMENTS?

If you want a body measurement, take your **waist** rather than your weight: it correlates best with health and is least sensitive to water swings. Measure at the navel, on waking, on day 0 / 30 / 60 / 90. And take three photos on day 0 - front, side, back, same light, same outfit. You'll hate them today and love them on day 90.

WORKSHOP · TO FILL IN · DAY 0

My starting point

Be honest, it's the only reason this page exists. You'll fill it in again on day 30, 60 and 90, and it's the comparison that will show you the distance covered.

THE SEVEN MARKERS - RATE FROM 1 TO 10

Morning energy	1	2	3	4	5	6	7	8	9	10
Sleep quality	1	2	3	4	5	6	7	8	9	10
Feeling of strength	1	2	3	4	5	6	7	8	9	10
Breath & recovery	1	2	3	4	5	6	7	8	9	10
Posture & back	1	2	3	4	5	6	7	8	9	10
Mood & stress	1	2	3	4	5	6	7	8	9	10
Self-confidence	1	2	3	4	5	6	7	8	9	10

MY BASELINE TESTS

Do them today, warmed up, without straining. These are your reference points - you'll repeat them on day 30, 60 and 90.

Push-ups in a row
hands on the edge of a table - note the height too

Plank hold
in seconds

Bodyweight squats
in 60 seconds

Wall sit
in seconds

Brisk walk
minutes without stopping

MY BODY MEASUREMENTS - optional

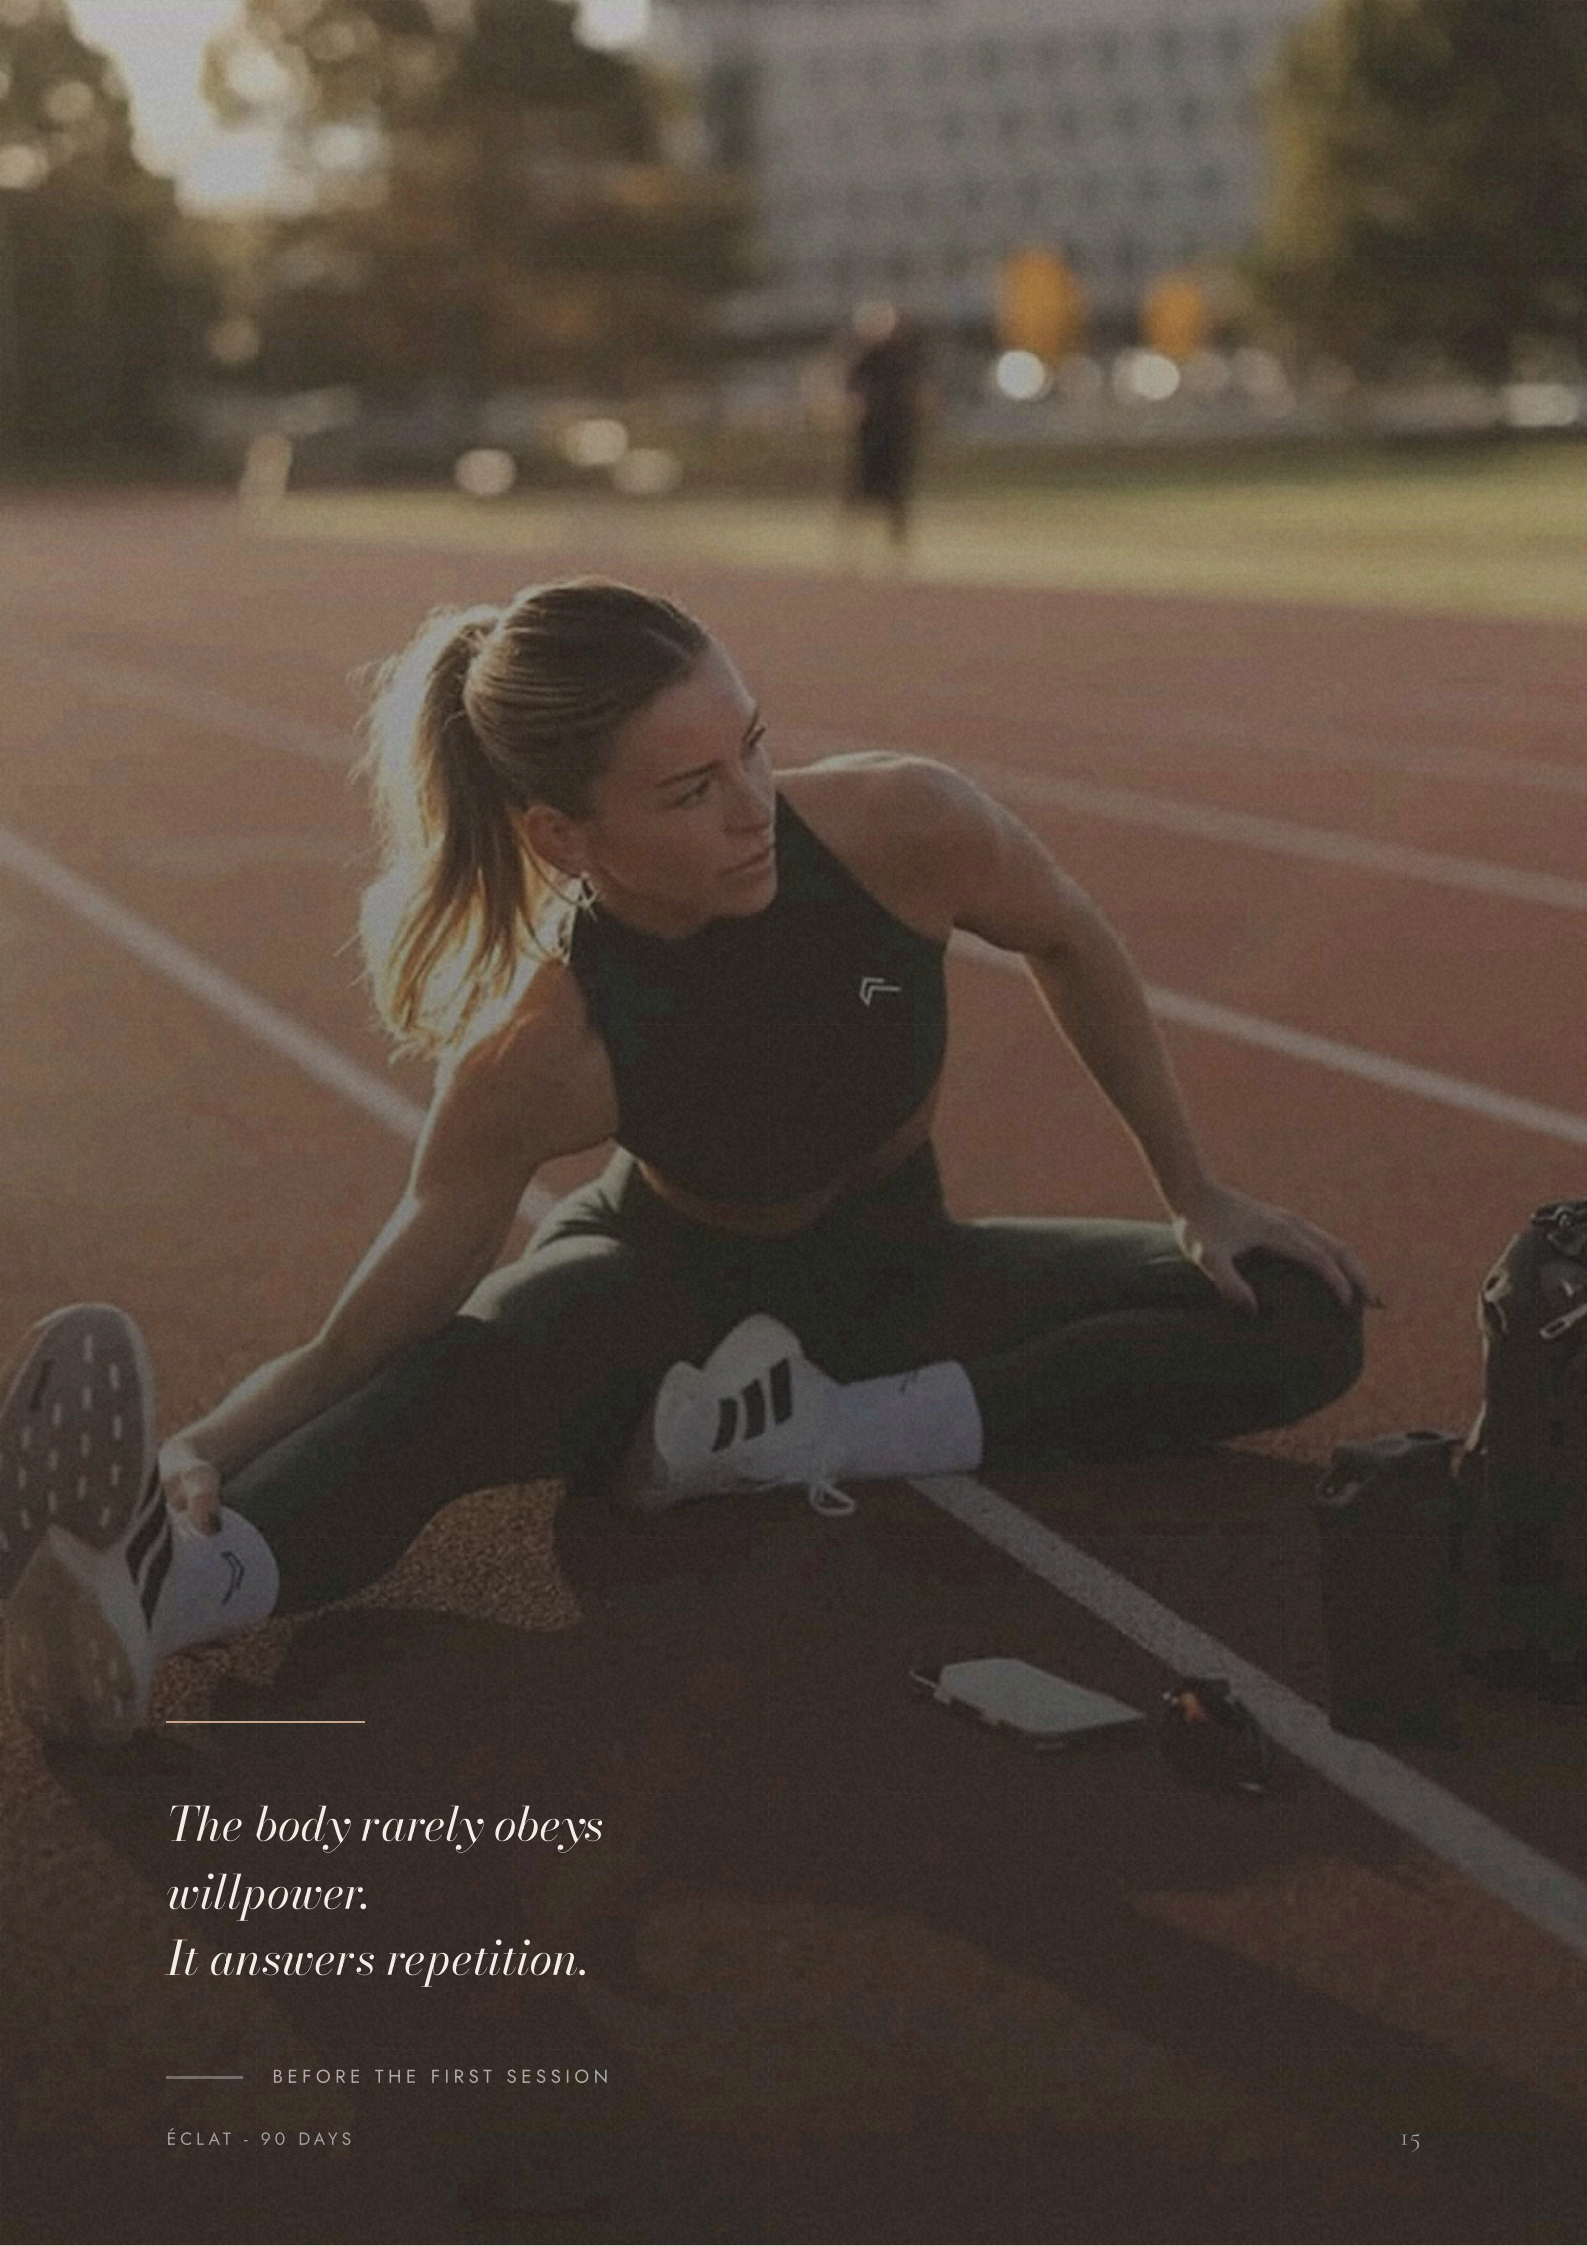

Waist
at the navel, on waking

Hips

Thigh

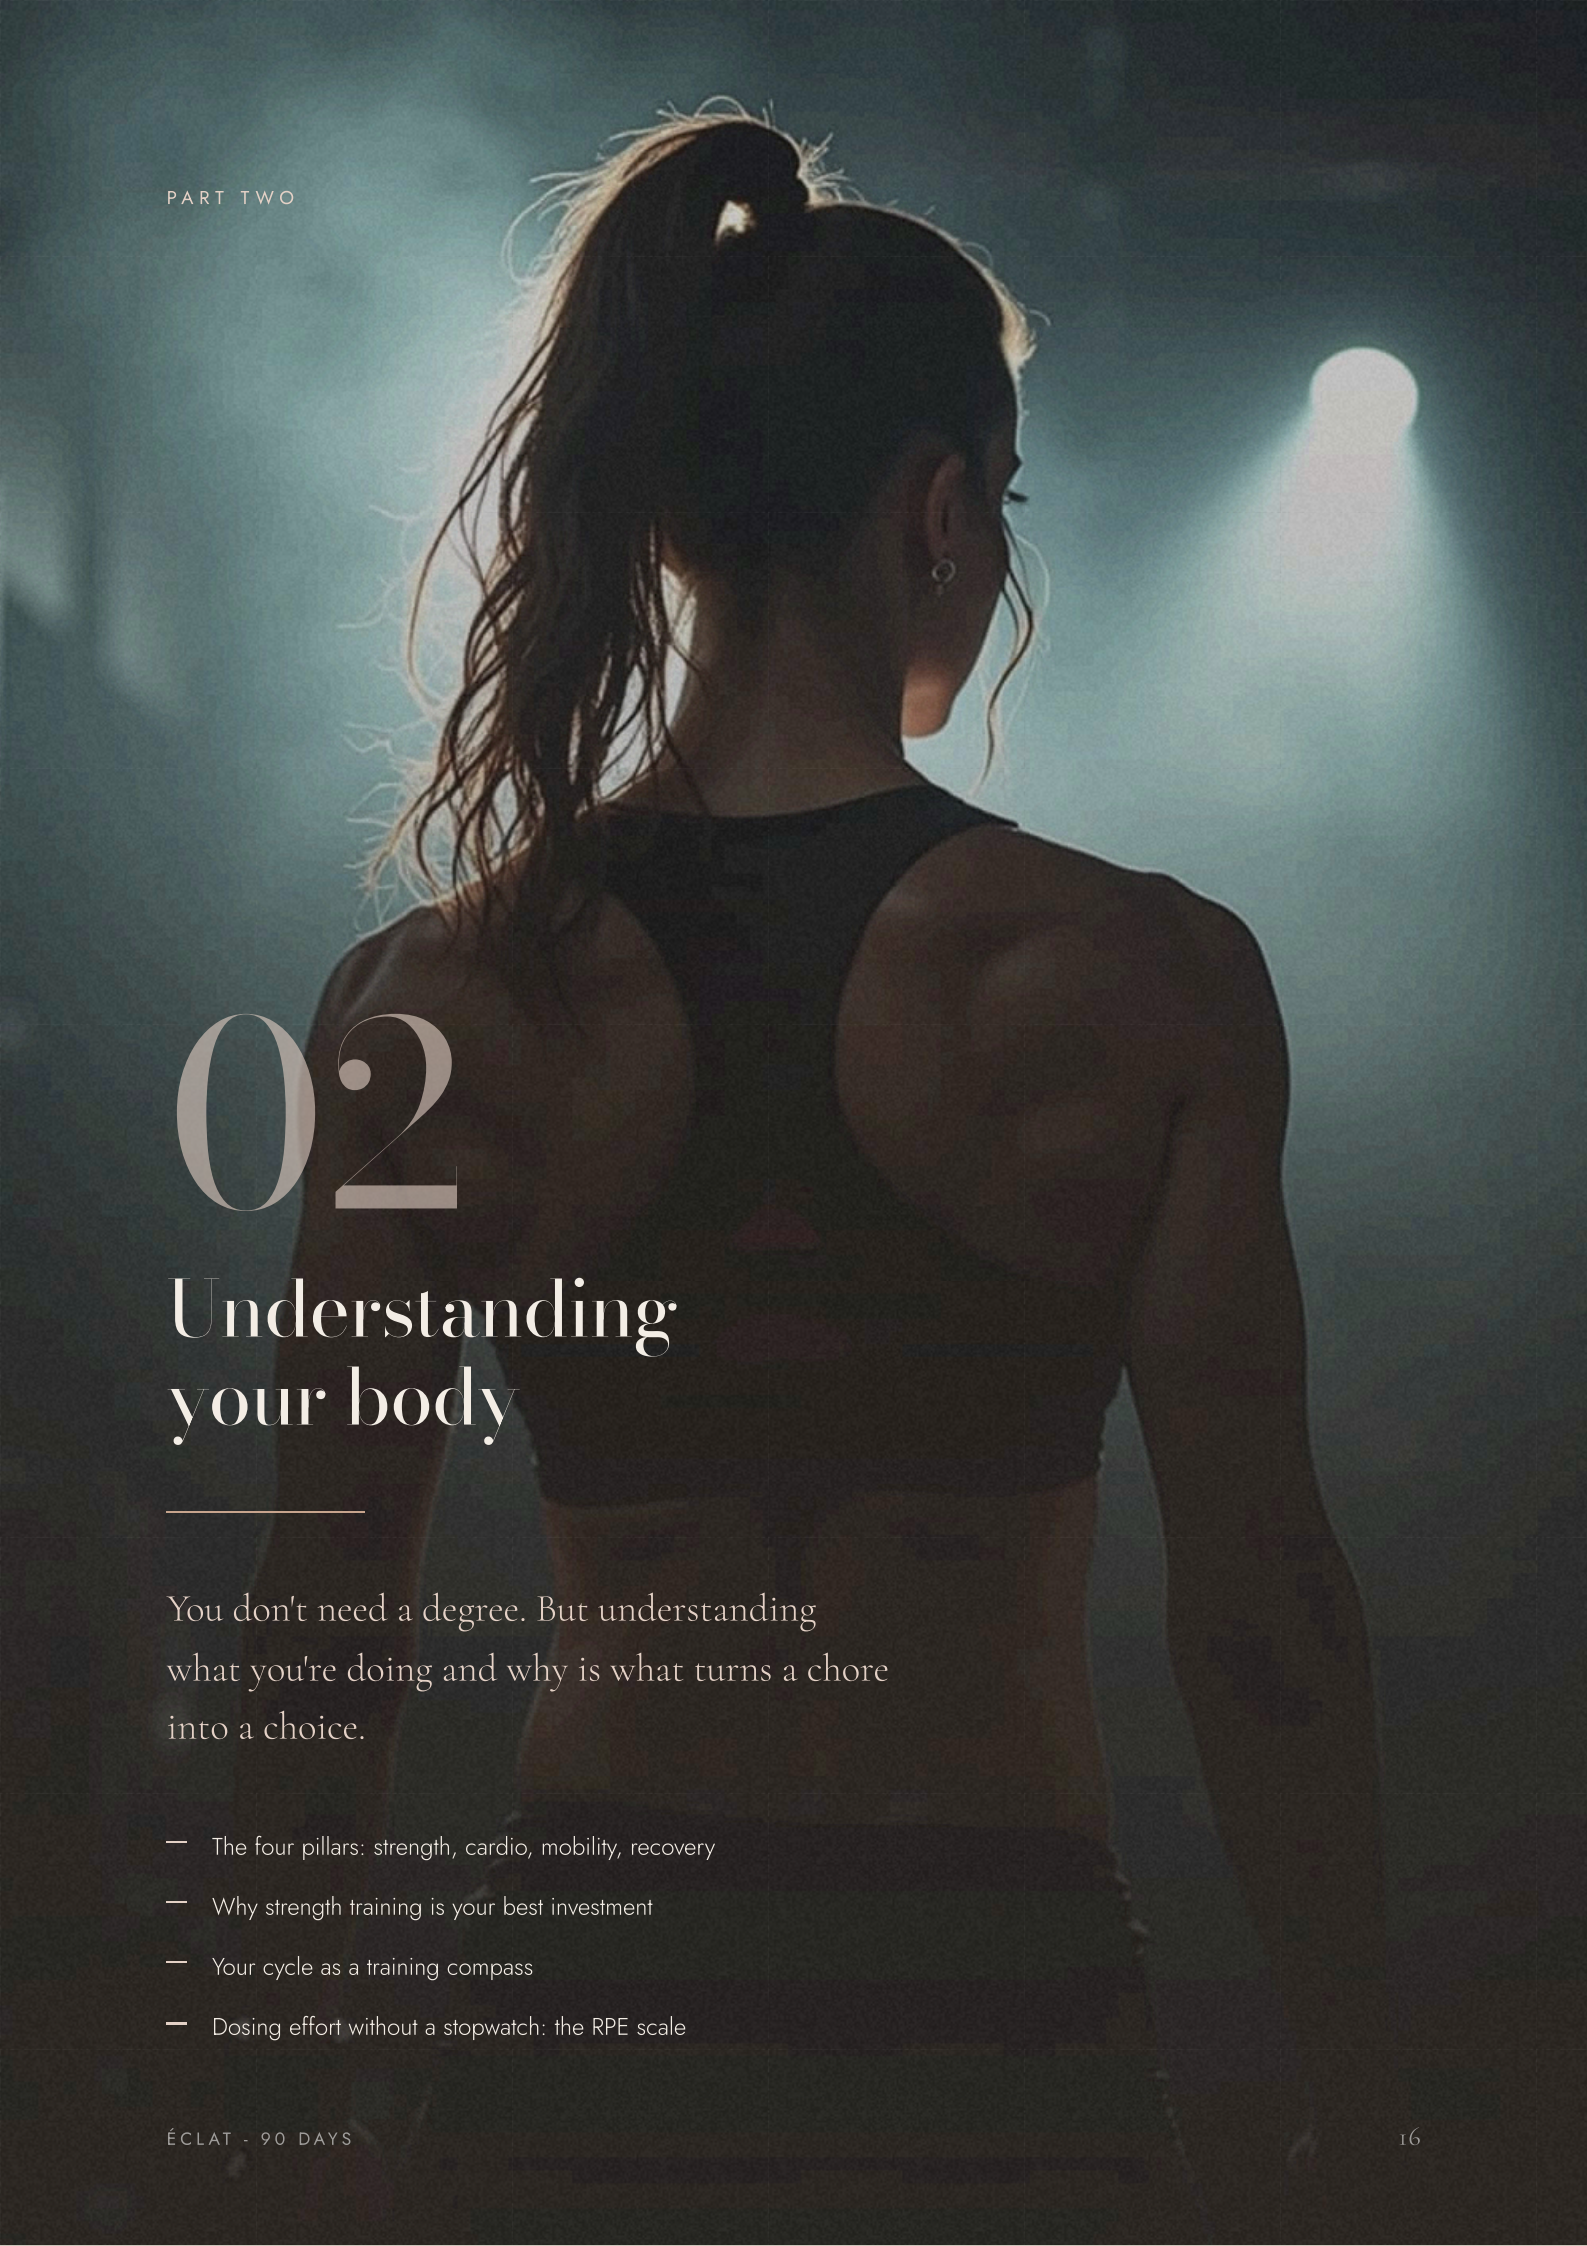

Weight
if you choose to track it

Day 0 photos taken ☐ front ☐ side ☐ back
Put them in a hidden album. You won't look at them before day 30.

The body rarely obeys willpower.
It answers repetition.

BEFORE THE FIRST SESSION

02

Understanding your body

You don't need a degree. But understanding what you're doing and why is what turns a chore into a choice.

- The four pillars: strength, cardio, mobility, recovery
- Why strength training is your best investment
- Your cycle as a training compass
- Dosing effort without a stopwatch: the RPE scale

The four pillars

Most programmes train one pillar only - usually cardio, because it "makes you sweat". It's the balance of all four that produces change that lasts.

Strength

2 TO 3 × / WEEK

The central pillar of this programme: lifting something heavy - your body or a load - against resistance.

What it changes: muscle mass, which shapes the silhouette; bone density, crucial from your thirties onwards; posture; and a feeling of power that spills well beyond the gym.

Cardio

3 TO 5 × / WEEK

Not necessarily running: walking fast, climbing a hill, cycling, swimming, dancing. What matters is duration, not intensity.

What it changes: recovery, everyday stamina, heart health and mood - the anti-stress effect of a 30-minute brisk walk is immediate.

Mobility

EVERY DAY, 7 MIN

The range through which your joints move *with control* - which is not the same as passive flexibility.

What it changes: less back and neck pain; better technique, so fewer injuries; and that feeling of being "unlocked" in the morning.

Recovery

NON-NEGOTIABLE

The pillar everyone skips, and the one that makes programmes fail. Muscle isn't built during the session, but during the rest that follows.

What it changes: everything. Without sleep and rest days you pile up fatigue without collecting the benefits, and you stop in week 6 convinced you "can't do it".

HOW THESE 90 DAYS BREAK DOWN

Per week: **3 strength sessions**, **1 cardio session**, **7,000 to 8,000 steps a day** on average, **7 minutes of mobility** daily and **2 days with no session**. Everything else in this guide is just how to put those five lines into practice.

“I don't want to get bulky”

It's the sentence I hear most often, and it's the biggest missed opportunity in women's fitness. It rests on a confusion: the idea that lifting heavy automatically produces size.

In reality, building muscle is **slow and difficult** - including for the people who do it professionally. A woman training seriously for strength gains on average 1 to 3 kg of muscle over a whole year, spread across the whole body. She doesn't “blow up”, she *fills out*.

In the mirror: defined shoulders that visually narrow the waist, glutes that lift, a flatter stomach at the same bodyweight. Exactly the effect wanted by everyone who says they want to “tone up”.

THREE REASONS TO START NOW

- **Muscle burns at rest.** More muscle means a slightly higher resting metabolism - and above all a much better tolerance for the odd indulgent meal.
- **Bone strengthens under load.** Women's bone capital declines from their thirties and drops at menopause. Strength training is the most effective lever on it, alongside impact activities such as running or skipping: what you build today, you'll still have at 60.
- **Strength changes your relationship with your body.** Lifting what you couldn't lift six weeks earlier produces a confidence that depends on nobody else's opinion.

THE REAL ISSUE

If your shape doesn't change in 90 days, it will never be because you “built too much muscle”. It will be because the load didn't increase. That's a fixable problem.

WHAT ACTUALLY HAPPENS, WEEK BY WEEK

S1 - S2

Nothing visible. The nervous system is learning the movements. Soreness at its peak - **this is where people quit.**

S3 - S5

Loads go up, soreness recedes. You feel stronger well before you see yourself change.

S6 - S9

Posture, shape, clothes hanging differently. People close to you notice before you do.

S10 - S12

Obvious in the side-by-side photos. And above all: training is no longer a decision.

Your cycle as a compass

You don't have the same energy every week of the month, and it's neither in your head nor a lack of willpower. Rather than fighting those swings, you can use them.

DAYS 1 - 5

Period

Hormones at their lowest, energy often low. The fatigue is real.

What works: walking, mobility, lighter strength work if you feel like it. Movement often reduces cramps - but nothing obliges you. *Rest without guilt.*

DAYS 6 - 13

Follicular

Oestrogen rises. Energy, mood and recovery at their best of the month.

What works: your window. Heavy loads, new exercises, tests. Put your most ambitious week here.

AROUND DAY 14

Ovulation

Peak strength, but looser ligaments: the knee is slightly more exposed.

What works: enjoy the strength, but mind your technique on squats, lunges and jumps. No improvised personal bests.

DAYS 15 - 28

Luteal

Progesterone and body temperature rise. Effort feels harder at the same load. Increased hunger: that's physiology.

What works: keep the rhythm, cut the volume rather than skipping. Gentler cardio, longer rests, more water.

How to use this in practice

The programme is built on fixed weeks, not on your cycle: a programme that reshuffles itself every month is a programme people abandon. You can, however, **swap two weeks** - if your test week falls during your period, trade it with the next one - and drop the load by 10 to 20 % in a luteal session without it counting as a failure.

Note your cycle days in the logbook. After two months your own pattern will appear - possibly different from this one.

TWO HONEST CAVEATS

On hormonal contraception (continuous pill, implant, hormonal coil), these phases don't exist in the same way, or at all. Go by your energy on the day.

And the research on cycle-based training remains **contested** : real but modest effects, highly variable between women. A lens to read your sensations through, not a rule.

Dosing effort without a stopwatch

Nowhere in this programme will you find a weight in kilos. The kilos that suit a 30-year-old who has been lifting for three years mean nothing to you today - and will mean nothing to you in six weeks' time.

So we use **RPE** : perceived effort, rated 1 to 10. The question to ask at the end of a set is always the same: *how many more reps could I have done?*

For the vast majority of sets, the target is **RPE 7 to 8** : it's hard, your technique stays clean, you had 2 to 3 reps left in reserve. The zone where you progress most for the least fatigue.

RPE	WHAT YOU FEEL	IN RESERVE
4-5	Easy. You could hold a whole conversation.	6 and more
6	It's starting to count, but it's comfortable.	4 - 5
7	**Hard but controlled.** Heavy breathing, clean movement.	3
8	**Very hard.** The last reps slow down.	2
9	Almost maximal. Technique starts to break down.	1
10	Failure. Not one more rep possible.	0

RPE 10 has no place anywhere in this programme, except on a deliberate test. It costs a lot in fatigue and brings almost nothing over RPE 8.

Zone 2, or "the sentence test"

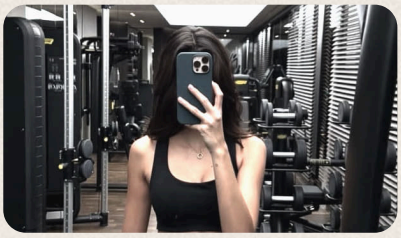

Aim for an intensity where you can say a full sentence while out of breath, but couldn't sing. Held for 30 to 45 minutes, it's the most effective zone for the heart and the easiest to repeat. Walking fast uphill is enough.

The 7,000 steps

The most underrated lever: activity outside your sessions weighs more in daily expenditure than the sessions themselves. Aim for 7,000 to 8,000 steps a day *as a weekly average* - a 3,000-step day is made up at the weekend. A pair of shoes by the door does more for this than any app.

Rest between sets

Cutting rests short doesn't make a session more effective, only more unpleasant. **90 seconds to 2 minutes** on the big lifts, 45 to 60 seconds on isolation work. Start again when your breathing has settled.

The subject nobody mentions

Before you lift anything heavy, there is one muscle to check. You can't see it, it never gets sore, and it decides whether these three months will do you good or leave you with a problem.

Why this concerns you

The pelvic floor is the hammock of muscle that closes the pelvis from below. Every time you strain - a heavy squat, a jump, a cough - the pressure in your abdomen rises and presses down on it. If it holds, all is well. If it's weakened, that repeated pressure weakens it further.

This isn't only about women who have given birth: chronic constipation, coughing and badly managed lifting all count too. **Close to one woman in three experiences leaking on exertion**, and most never mention it to anyone. It responds very well to rehabilitation.

> THE RULE THAT CHANGES EVERYTHING
>
> **Breathe out during the effort.** On the way up out of a squat, on the press overhead, at the exact moment it gets hard: you exhale. Never hold your breath under load. It costs nothing and it protects your pelvic floor as much as your blood pressure.

THE THREE-QUESTION CHECK

- [ ] Any leaking when you cough, sneeze, laugh, jump or lift something heavy?
- [ ] A feeling of heaviness or of a "bulge" low in the abdomen at the end of the day?
- [ ] Difficulty holding in wind on purpose, or very urgent needs to urinate?

A single box ticked → book an appointment with a midwife or a specialist physiotherapist before block 2. It is neither serious nor permanent, but it is treated best early.

In the meantime: block 1 can be done as written, it contains neither jumping nor heavy loads. After that, swap every jumping movement for its grounded version - already given in each table - and stay at RPE 7 rather than 8.

The abdominal gap

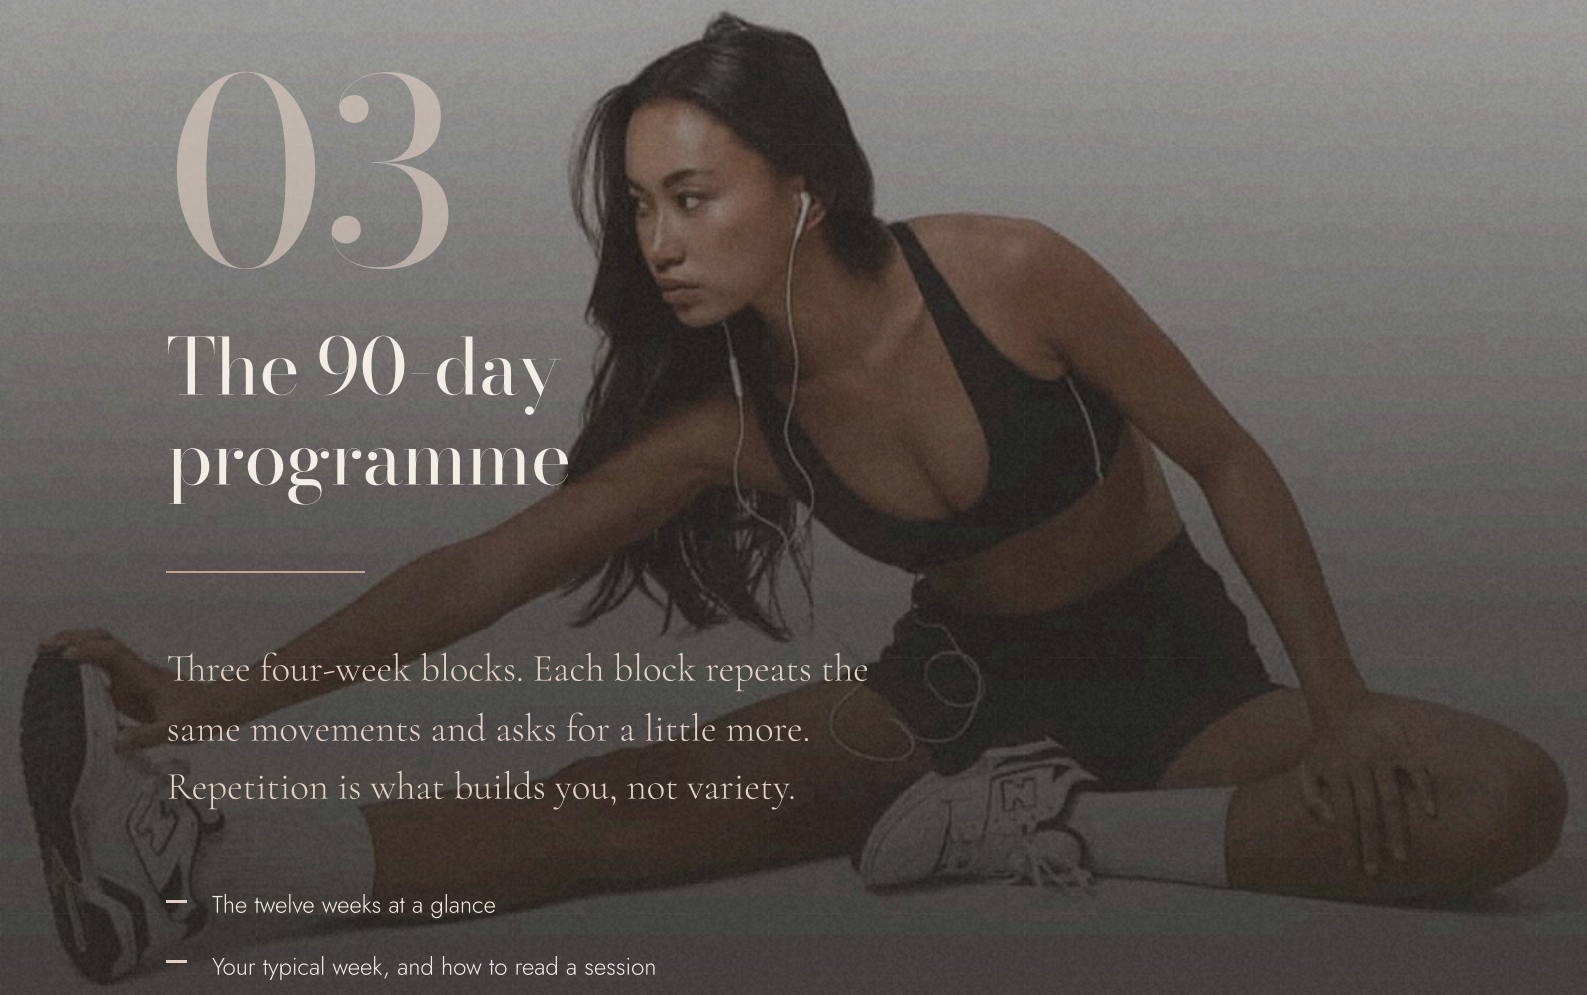

During pregnancy the two vertical bands of the abdominal muscle separate to make room. In most women they come back together on their own within the year; in others the gap stays. It's called a diastasis, and while it's there certain exercises widen it instead of closing it.

The test - lying on your back, knees bent: lay two flat fingers just above the navel, then just below. Lift your head and shoulders as if starting a small curl-up. Do your fingers sink into a gap, and how many fit side by side?

Fewer than 2 fingers
Nothing to change.

2 fingers or more, or a ridge down the middle when you strain: replace **plank**, **hollow hold** and **mountain climbers** with **dead bug** done slowly - it's already in the programme and it's exactly the right exercise. And get it checked.

In every case: if your stomach forms a vertical ridge down the middle when you strain, stop the exercise. That effort isn't going where it should.

03

The 90-day programme

Three four-week blocks. Each block repeats the same movements and asks for a little more. Repetition is what builds you, not variety.

- The twelve weeks at a glance
- Your typical week, and how to read a session
- The universal warm-up, five minutes
- The nine sessions, home version and gym version
- Progressing: the +1 rule and the deload week

The twelve weeks at a glance

BLOCK	WEEKS	INTENTION	FORMAT	RPE	SESSIONS
01	1 to 4	**Foundations** *Learning the eight basic movements, building the habit before building the load.*	3 × full body	6 - 7	3 strength + 1 cardio
02	5 to 8	**Building** *Splitting upper and lower body to work each area for longer. The loads climb markedly.*	1 lower · 1 upper · 1 full	7 - 8	3 strength + 1 cardio
03	9 to 12	**Éclat** *Fewer reps, more load, a finisher at the end of every session. Week 12 is a testing week.*	1 lower · 1 upper · 1 full	8	3 strength + 2 cardio

Week by week in detail

W1 Getting the hang of it. Only 2 sets per exercise, RPE 6. You should finish thinking "I could have done more". That's deliberate.

W2 - W3 3 sets. The load goes up as soon as you reach the top of the rep range.

W4 DELOAD Same sessions, 2 sets, loads cut by 30 %. You recover, and that's when the body consolidates.

W5 - W7 Upper / lower split. The highest volume of the programme. It's the most demanding stretch.

W8 DELOAD Second wind. Day 60 review at the end of the week.

W9 - W11 The heaviest loads, lower reps, a finisher.

W12 TESTS You redo the five tests from page 14 and compare. Then you celebrate.

WHY DELOAD WEEKS

Fatigue builds faster than the ability to recover from it. Without a deload you arrive at week 7 exhausted, you stall, and you conclude that "it isn't working". Weeks 4 and 8 aren't pauses: they're where the progress of the previous three becomes real. **Don't skip them.**

IF YOU HAVE TO SKIP A WEEK

Illness, travel, life. You don't start from scratch: you pick up the week you stopped at, with 10 % less load on the first session. Two weeks or more off: restart at the beginning of the current block.

Your typical week

	MON	TUE	WED	THU	FRI	SAT	SUN
Strength	A		B		C		
Cardio						30-45 min	
Mobility							
Steps							

This layout is a model, not an obligation. What matters: **one rest day between two strength sessions**, and never three days in a row with nothing. Shift the days however you like - Tuesday / Thursday / Saturday works just as well.

How to read a session

3 × 10-12	Three sets of 10 to 12 reps. As long as you're at the bottom of the range, you keep the load. As soon as you do 12 on all three sets cleanly, you go up.
RPE 7	The target effort (page 20). At the end of the set you had about 3 reps left in reserve.
Rest 90 s	Between every set. Time it for the first few weeks: everyone cuts it short without noticing.
Tempo 3-1-1	Three seconds down, one pause, one up. It replaces load on a bodyweight exercise.
Superset *written A1 / A2*	Two exercises back to back with no rest, then the rest. Time saved with no loss of effectiveness.
Finisher	The short, intense block at the end of a session. Optional on the off days.
Breathing	True of every set of every session: **you breathe out during the effort**, never hold your breath under load. See page 21.

HOME OR GYM?

Every line gives both versions: **home** first, **gym** in italics below. Sets and reps identical.

The minimum: a mat, a chair, a loaded backpack. For £25 - a **resistance band** and a **pair of 4 to 6 kg dumbbells** - you unlock half the programme.

THE GOLDEN RULE

One clean rep beats three sloppy ones. If your form breaks down - rounded back, knees caving in, shoulders up by your ears - you end the set. That isn't giving up: that's a successful set.

The universal warm-up

Five minutes, before each of the nine sessions. Non-negotiable: it's the difference between a three-month programme and a three-week one cut short by a shoulder niggle.

PART 1 - WAKING THE CIRCULATION · 2 min

High-knee march on the spot	45 s
Butt kicks	30 s
Arm circles, forwards then backwards	30 s
Torso rotations, feet planted	30 s

PART 2 - OPENING THE JOINTS · 3 min

Cat-cow on all fours *Mobilises the whole spine, breathe along with it*	10 ×
Deep squat hold *Heels down if you can, elbows pushing the knees apart*	30 s
Lunge with rotation *Opens the hip and the upper back in one movement*	5 / side
Glute bridge *Switches the glutes on before you load them*	15 ×
Shoulder pass-throughs with a stick or a towel *Wide grip, arms straight, slowly*	10 ×

THEN: THE WARM-UP SETS

On the **first heavy exercise** of the session only, do a set of 8 reps empty or very light before your first real set. It doesn't count towards the prescribed sets.

It isn't wasted time: it's the rep where your body finds the movement again, and where you check that everything feels right today. It's also where you pick the session reflex back up: **breathe out on the effort.**

THE FIVE-MINUTE RITUAL

While you warm up, set the session up: start your playlist, fill your bottle, open the session page, move your phone out of sight. The warm-up isn't only physical - it's the airlock that takes you from your day into your session.

WHAT NOT TO DO BEFOREHAND

No long passive stretches (holding 30 seconds without moving) before a strength session: they temporarily reduce force production and have never been shown to protect anything. They have their place **afterwards** - see the evening routine, part 5.

And the cool-down? Three minutes of slow walking and a few long breaths are enough. The aim is to bring the heart rate down, not to stretch: your body needs to shift from effort mode to recovery mode, and that's when the session starts being digested.

Foundations

For four weeks you aren't trying to outdo yourself. You're trying to *do it well*, and to miss no session. Everything else follows from that.

THE REAL GOAL

Establishing three weekly appointments and learning eight movements. If after four weeks you've done 10 sessions out of 12 with clean technique, this block is a complete success - whatever the load.

WHAT WILL BE HARD

The soreness of the first two weeks, and the feeling that "this isn't enough". You'll finish sessions thinking you could have done more. That is exactly the intention: we're building a base, not a performance.

THE LOAD INSTRUCTION

Week 1: **2 sets** only per exercise, RPE 6. Weeks 2 and 3: **3 sets**, RPE 7. Week 4: deload, 2 sets with the load cut by 30 %.

SESSION A

Anchor

Lower-body and pushing emphasis. 35 min.

SESSION B

Hinge

Posterior chain and pulling emphasis. 35 min.

SESSION C

Full circuit

Whole body in a circuit, more cardio. 30 min.

THE EIGHT MOVEMENTS OF THE PROGRAMME

Squat · Hip hinge · Horizontal push · Vertical push · Horizontal pull · Vertical pull · Lunge · Core. They stay the same for 90 days. What changes is the load and the mastery.

BLOCK 01 · FOUNDATIONS · WEEKS 1 TO 4

A Anchor

Full body · 35 minutes · lower-body & pushing emphasis

WARM-UP - 5 MIN, PAGE 25

THE MAIN BLOCK

EXERCISE	SETS	REPS	RPE	REST
1 · Goblet squat *Home: bodyweight squat, or a loaded backpack hugged to the chest* *Gym: goblet squat with a dumbbell or a kettlebell*	3	10 - 12	6-7	90 s
2 · Glute bridge *Home: on the floor, then shoulder blades on the sofa once that's too easy* *Gym: hip thrust, back on a bench, bar or dumbbell across the hips*	3	12 - 15	7	75 s
3 · Incline push-ups *Home: hands on the kitchen counter - the higher, the easier* *Gym: dumbbell bench press, or chest press machine*	3	8 - 10	7	90 s
4 · Band row *Home: band looped around a table leg, seated with legs straight* *Gym: seated cable row*	3	12 - 15	7	75 s
5 · Alternating reverse lunge *Home: bodyweight, one hand on the wall if balance is short* *Gym: light dumbbells by your sides*	2	8 / leg	6-7	60 s
6 · Planche *On your forearms, pelvis tucked. Knees down if the lower back sags*	3	20 - 30 s	7	45 s

FINISHER - OPTIONAL

10 minutes of brisk walking, outside if possible. The aim is to bring the heart rate down while moving, not to exhaust yourself.

THE COACH'S NOTE

This is the session where you learn the squat, and the squat underpins everything else in the programme. On every descent, ask yourself two questions: **are my heels staying on the floor?** et **are my knees tracking outwards, in line with my feet?** If the answer is no to either, reduce the range - go less deep - rather than letting the position break down. The range will come on its own within three weeks.

MY LOADS

	W1	W2	W3
1 · Goblet squat			
2 · Glute bridge			
3 · Incline push-ups			
4 · Row			
5 · Reverse lunge			
6 · Planche			

Write down the load and the reps you actually did. This table, and nothing else, is what will tell you in week 4 that you've progressed.

BLOCK 01 · FOUNDATIONS · WEEKS 1 TO 4

B Hinge

Full body · 35 minutes · posterior chain & pulling emphasis

WARM-UP - 5 MIN, PAGE 25

THE MAIN BLOCK

EXERCISE	SETS	REPS	RPE	REST
1 · Romanian deadlift *Home: a loaded backpack held in both hands, or two 1.5 L bottles* *Gym: dumbbells or a bar, legs almost straight*	3	10 - 12	7	90 s
2 · Split squat *Home: a long step forward, lowering on the spot · Gym: dumbbell split squat*	2	8 / leg	7	75 s
3 · Band lat pulldown *Home: band wedged at the top of a door, kneeling · Gym: cable pulldown*	3	12	7	75 s
4 · Shoulder press *Home: two water bottles or a backpack · Gym: seated dumbbells, backrest at 85°*	3	10	7	75 s
5 · Dead bug *Lying down, lower back pressed to the floor, opposite arm and leg reaching away slowly*	3	8 / side	6	45 s
6 · Superman *Face down, lift chest and legs, 2 seconds at the top*	2	12	6	45 s

FINISHER - OPTIONAL

3 × 30 seconds of side plank per side, 30 seconds of rest between each.

THE COACH'S NOTE

The Romanian deadlift is the most useful and the most badly performed movement in the programme. It is **not** a back movement: it's a **hip** movement. Push your hips back toward an imaginary wall behind you, back flat, the load brushing your thighs. You should feel the back of your thighs stretch - never your lower back pulling. If you do, you're going too low or rounding.

MY LOADS

	W1	W2	W3
1 · Romanian deadlift			
2 · Split squat			
3 · Lat pulldown			
4 · Shoulder press			
5 · Dead bug			
6 · Superman			

If an exercise feels easy two sessions in a row, that's the signal: increase the load next time.

BLOCK 01 · FOUNDATIONS · WEEKS 1 TO 4

C Full circuit

Whole body circuit · 30 minutes · strength & cardio

WARM-UP - 5 MIN, PAGE 25

THE FORMAT

The six exercises in order, with no rest other than the 20 seconds built in. One round takes 6 minutes.

3	40s	20s	60s
rounds	work	rest	between rounds

	EXERCISE	WHAT TO WATCH	RPE
1	**Bodyweight squat** *Gym: light goblet squat*	Steady rhythm, no bouncing at the bottom	7
2	**Incline push-ups** *Hand height set so you can hold the 40 s*	Elbows at 45°, not flared out wide	7
3	**Band row** *Gym: low cable row*	Shoulder blades squeezing, shoulders down	7
4	**Step-up onto a step** *Alternating, on a stair or a stable bench*	Push with the top leg, no swinging	7
5	**Glute bridge** *One-second pause at the top of every rep*	Squeeze the glutes, ribs down	7
6	**Side plank** *20 seconds on each side*	Hips high, body in line from head to feet	7

TO FINISH

15 minutes of brisk walking - this is your cardio session for the week if you do no other.

THE COACH'S NOTE

In a circuit, the temptation is to rush to "get more done". **40 seconds of clean movement beats 40 seconds of flailing.** If you can't hold the 40 seconds, stop, breathe, start again: that's normal for the first two weeks.

MY TRACKING

	W1	W2	W3	W4
Rounds comple				
Overall feel / 1				
Minutes walked				

If you only have 15 minutes: two rounds instead of three, and no walk. A shortened session is still a session done - and here, a session done counts infinitely more than a perfect one.

Building

The movements are in place. We split upper and lower body to work each area for longer, and the loads climb markedly.

THE REAL GOAL

Increasing the load on every exercise at least once per three-week stretch. This is where your shape starts to change, because this is where the work volume becomes enough.

WHAT WILL BE HARD

This is the most demanding stretch of the 90 days, and also the one where the novelty of the start has worn off. Weeks 6 and 7 are the real test. Reread your contract on page 6 if you need to.

THE LOAD INSTRUCTION

Weeks 5 to 7: RPE 7 to 8, go up as soon as the top of the range is reached on every set. Week 8: deload, 2 sets at −30 %, then the day 60 review.

SESSION A

Lower body

Legs and glutes, heavy loads. 45 min.

SESSION B

Upper body

Back, shoulders, chest and arms. 45 min.

SESSION C

Full body & cardio

A more intense circuit, then zone 2. 40 min.

THE MAIN CHANGE FROM BLOCK 1

You stay at six exercises, but go from 3 to 4 sets on the main movements, and you add a finisher. Weekly volume rises by about 40 %. That is why the week 8 deload is compulsory.

BLOCK 02 · BUILDING · WEEKS 5 TO 8

A Lower body

Legs & glutes · 45 minutes · the heaviest loads of the week

WARM-UP - 5 MIN, PAGE 25

THE MAIN BLOCK

EXERCISE	SETS	REPS	RPE	REST
1 · Goblet squat *Home: loaded backpack, or a dumbbell if you have one · Gym: barbell squat or heavy goblet*	4	8 - 10	7-8	2 min
2 · Romanian deadlift *Home: backpack held in both hands · Gym: dumbbells or a bar*	3	10 - 12	8	90 s
3 · Bulgarian split squat *Back foot on a chair or a bench · Home: bodyweight · Gym: dumbbells*	3	8 / leg	7-8	90 s
4 · Glute bridge, 2 s pause at the top *Home: shoulder blades on the sofa, load on the hips · Gym: barbell hip thrust*	3	12	8	75 s
5 · Banded hip abduction *Band above the knees, seated or lying on your side*	3	20	7	45 s
6 · A1 Banded leg curl *Face down, band around the ankles anchored in front - bend the knees*	3	12	7	-
6 · A2 Standing calf raise on a step *Full range, 1 second pause at the top and the bottom*	3	15	7	45 s

FINISHER

Wall sit: 3 × as long as you can hold, 60 seconds of rest between each. Write your times down, they climb fast.

THE COACH'S NOTE

The Bulgarian split squat is the highest-yield exercise in this session and the most hated. It corrects the imbalances between your two legs, hits the glutes enormously, and needs no equipment. Start by **resting only the toes of the back foot** on the chair, torso leaning slightly forward. If balance is short, keep a finger on a wall: it takes nothing away from the work.

MY LOADS

	W5	W6	W7
1 · Goblet squat			
2 · Romanian deadlift			
3 · Bulgarian split squat			
4 · Glute bridge			
5 · Abduction			
6 · Leg curl / calves			
Wall sit - time			

B

BLOCK 02 · BUILDING · WEEKS 5 TO 8

Upper body

Back, shoulders, chest & arms · 45 minutes

WARM-UP - 5 MIN, PAGE 25

THE MAIN BLOCK

EXERCISE	SETS	REPS	RPE	REST
1 · Pompes *Progression: incline → knees down → feet down. Drop back a level as soon as form breaks down*	4	max – 2	8	90 s
2 · Single-arm row *Home: loaded bag, knee and hand resting on a chair · Gym: dumbbell or cable*	4	10 / arm	8	90 s
3 · Shoulder press *Home: bottles or a backpack · Gym: seated dumbbells*	3	10	8	75 s
4 · Lat pulldown *Home: band anchored at the top of a door · Gym: cable pulldown or assisted pull-up*	3	10 - 12	8	75 s
5 · A1 Lateral raises *Straight into A2 with no rest, then rest. Bottles or light dumbbells*	3	12 - 15	7	-
5 · A2 Biceps curl *Elbows tight to the body, no swinging from the back*	3	12	7	60 s
6 · B1 Overhead triceps extension *A bottle or a dumbbell held in both hands, elbows in*	3	12	7	-
6 · B2 Banded external rotation *Elbow tight to the body, forearm rotating outwards. Protects the shoulder*	2	15 / arm	6	60 s

FINISHER

Plank: 3 × 40 seconds, 30 seconds of rest.

THE COACH'S NOTE

The upper-body session is the one women skip most often, and that's a mistake: it's the one that straightens your posture and shapes your shoulders - so it's the one that visually narrows your waist. On the row, think **"elbow toward the hip"** rather than "pull with the arm".

MY LOADS

	W5	W6	W7
1 · Push-ups - level			
2 · Single-arm row			
3 · Shoulder press			
4 · Lat pulldown			
5 · Raises / curl			
6 · Triceps / rotation			

BLOCK 02 · BUILDING · WEEKS 5 TO 8

C Full body & cardio

Circuit + zone 2 · 40 minutes · the session that makes you sweat

WARM-UP - 5 MIN, PAGE 25

THE FORMAT

Six exercises back to back, 45 seconds of work, 15 of transition. One round takes 6 minutes.

4	45s	15s	60s
rounds	work	rest	between rounds

	EXERCISE	GENTLER VERSION
1	Jump squat	Fast squat without leaving the floor
2	Push-ups	Hands raised on a chair
3	Alternating reverse lunge	Split squat, one leg then the other
4	Fast band row	Same movement, slower tempo
5	Mountain climbers	Hands on a table, walking pace
6	Hollow hold	Slow dead bug, lower back on the floor

TO FINISH - ZONE 2

20 minutes of brisk walking, cycling or rowing at an intensity where you can still say a full sentence while out of breath. No harder: the point is the duration.

THE COACH'S NOTE

This session has two goals that mustn't be confused. The circuit trains your ability to repeat effort; zone 2 trains your heart over time. **Don't turn zone 2 into a race.** If you finish the 20 minutes too breathless to speak, you went too hard, and you'll find it harder to recover for the next session.

MY TRACKING

	W5	W6	W7	W8
Rounds comple				
Minutes of zone				
Feel / 10				

Week 8: deload. Three rounds instead of four, and 15 minutes of zone 2. Then fill in your day 60 review on page 61.

Éclat

Two months behind you. Your body knows how, your diary knows how. We can finally go after what you thought you were incapable of on day 1.

THE REAL GOAL

Fewer reps, more load, a finisher in every session. And above all: redoing the five tests from page 14 in week 12, and measuring what has changed.

WHAT WILL BE HARD

Nothing, really, compared with block 2 - but you don't believe that yet. The only real risk in this block is an injury born of overconfidence. Keep technique ahead of load.

THE LOAD INSTRUCTION

RPE 8 on the main movements: you have 2 reps left in reserve, never zero. You never go to failure on a heavy exercise, not even in week 12.

SESSION A

Lower · Strength

The programme's heaviest loads. 50 min.

SESSION B

Upper · Strength

Progress on push-ups and pulling. 50 min.

SESSION C

Power

An intense circuit, the session that lets it all out. 40 min.

WEEK 12 - THE TESTING WEEK

The last three sessions are done with the load cut by 20 %, and you redo the day 0 tests at the end of the week: push-ups, plank, squats in 60 seconds, wall sit, walk. Then you fill in the day 90 review and compare. This is the moment in the guide everything else was written for.

BLOCK 03 · ÉCLAT · WEEKS 9 TO 12

A Lower · Strength

Legs & glutes · 50 minutes · the heaviest loads of the 90 days

WARM-UP - 5 MIN, PAGE 25

THE MAIN BLOCK

EXERCISE	SETS	REPS	RPE	REST
1 · Squat *Home: heavy backpack, or a single-leg squat progression · Gym: barbell squat*	4	6 - 8	8	2 min
2 · Heavy glute bridge *Home: shoulder blades on the sofa, the heaviest load you have · Gym: barbell hip thrust*	4	8 - 10	8	2 min
3 · Romanian deadlift *3-second tempo on the way down · Home: loaded bag · Gym: dumbbells or a bar*	3	8 - 10	8	90 s
4 · Walking lunges *Walking forward, 10 steps per leg · If space is short: Bulgarian split squat*	3	10 / leg	8	90 s
5 · A1 Banded hip abduction *Straight into A2 with no rest*	3	20	7	-
5 · A2 Standing calf raise *On a step, full range*	3	15	7	60 s

FINISHER

Heavy carry - 4 there-and-back trips of 20 steps, the heaviest load you can hold, arms by your sides, shoulders down, core tight. It's the most transferable movement in the programme: carrying the shopping, a suitcase, a child. Write down the load and the distance.

THE COACH'S NOTE

With 6 to 8 reps, the classic mistake is jumping too heavy at once. A reminder: **RPE 8 means you have 2 reps left in reserve**. If your fourth set is a fight in which your back rounds, the load is too high - and at this stage of the programme an injury would cost far more than two kilos less on the bar.

MY LOADS

	W9	W10	W11
1 · Squat			
2 · Glute bridge			
3 · Romanian deadlift			
4 · Walking lunges			
5 · Abduction / calves			
Carry - load			

BLOCK 03 · ÉCLAT · WEEKS 9 TO 12

B Upper · Strength

Back, shoulders, chest & arms · 50 minutes

WARM-UP - 5 MIN, PAGE 25

THE MAIN BLOCK

EXERCISE	SETS	REPS	RPE	REST
1 · Feet-elevated push-ups *Feet on a chair · If that's too much: standard floor push-ups, 4 × 8*	4	6 - 10	8	2 min
2 · Heavy single-arm row *Home: backpack loaded as heavy as it goes · Gym: dumbbell, supported on a bench*	4	8-10 / arm	8	90 s
3 · Shoulder press *Standing, core tight · Home: bottles or a bag · Gym: dumbbells*	4	8	8	90 s
4 · Lat pulldown or assisted pull-up *Home: band anchored high up, the strongest one you own*	4	8 - 10	8	90 s
5 · A1 Lateral raises *Straight into A2 with no rest*	3	15	7-8	-
5 · A2 Chair dips *Hands on the edge of a chair, legs straight to make it harder*	3	10	8	60 s

FINISHER

Plank: 3 × 60 seconds, 45 seconds of rest. If you hold it easily, add an alternating shoulder tap every two seconds.

THE COACH'S NOTE

This is the session where many discover they can do a real floor push-up - often between weeks 9 and 11. If that isn't the case yet, it isn't a failure: push-up progress is among the slowest there is. Keep lowering your hand height by a few centimetres every two weeks, it always comes in the end.

MY LOADS

	W9	W10	W11
1 · Push-ups - level			
2 · Single-arm row			
3 · Shoulder press			
4 · Lat pulldown			
5 · Raises / dips			
Plank - time			

BLOCK 03 · ÉCLAT · WEEKS 9 TO 12

Power

Whole-body circuit · 40 minutes · the session that lets it all out

WARM-UP - 5 MIN, PAGE 25

THE FORMAT

Five rounds, six exercises. You're allowed to slow down, not to stop before the round is over.

5	40s	20s	90s
rounds	work	rest	between rounds

	EXERCISE	GENTLER VERSION
1	Thruster - squat + press	Squat only, arms by your sides
2	Burpee	Step-back burpee, no jump, no push-up
3	Alternating jump lunge	Alternating reverse lunge on the floor
4	Fast band row	Same movement, controlled tempo
5	Mountain climbers	Hands on a chair, walking pace
6	Dynamic plank - shoulder taps	Static plank, knees down

TO FINISH

5 minutes of slow walking and ten long breaths, lying down. In for 4, out for 8. That's what tips the body into recovery mode.

THE COACH'S NOTE

This session is meant to be **uncomfortable, not dangerous**. Burpees and jump lunges are the two movements where technique falls apart fastest under fatigue. The moment you feel you're collapsing rather than lowering, switch to the gentler version for the rest of the round. You'll get the same cardiac benefit, without the risk.

MY TRACKING

	W9	W10	W11	W12
Rounds comple				
Full versions				
Feel / 10				

Week 12: three rounds only, then the tests on page 14. You're done.

Progressing, in practice

A programme doesn't make you progress. Steadily increasing the demand makes you progress - and there's only one rule to remember.

THE +1 RULE

In every session, look for **one single** of these five improvements on each exercise. One is enough. In order of priority:

01 **One more rep**
Up to the top of the prescribed range.

02 **A heavier load**
When you reach the top of the range on every set. Go up by 1 to 2.5 kg, no more.

03 **A bigger range**
Going a little lower on the squat, touching your chest on the push-up.

04 **A slower tempo**
3 seconds down instead of 1. Free, and brutal.

05 **Less rest**
As a last resort only, and never on the heavy movements.

WHEN YOU STALL

Three sessions without progress on an exercise isn't a failure: it's a signal. In order, check:

- **Sleep.** Under 7 hours for several nights blocks progress before anything else does.
- **Protein.** Without enough of it, muscle doesn't rebuild. It's the only nutrition point that really matters here.
- **Rest between sets.** You cut it short without noticing the moment you're in a hurry.
- **The actual load.** Reread your table: often you think you've gone up when you've been at the same load for three weeks.

If everything checks out and it's still stalled: take a deload week early. It's almost always that.

AND AFTER DAY 90?

Three options, all of them valid:

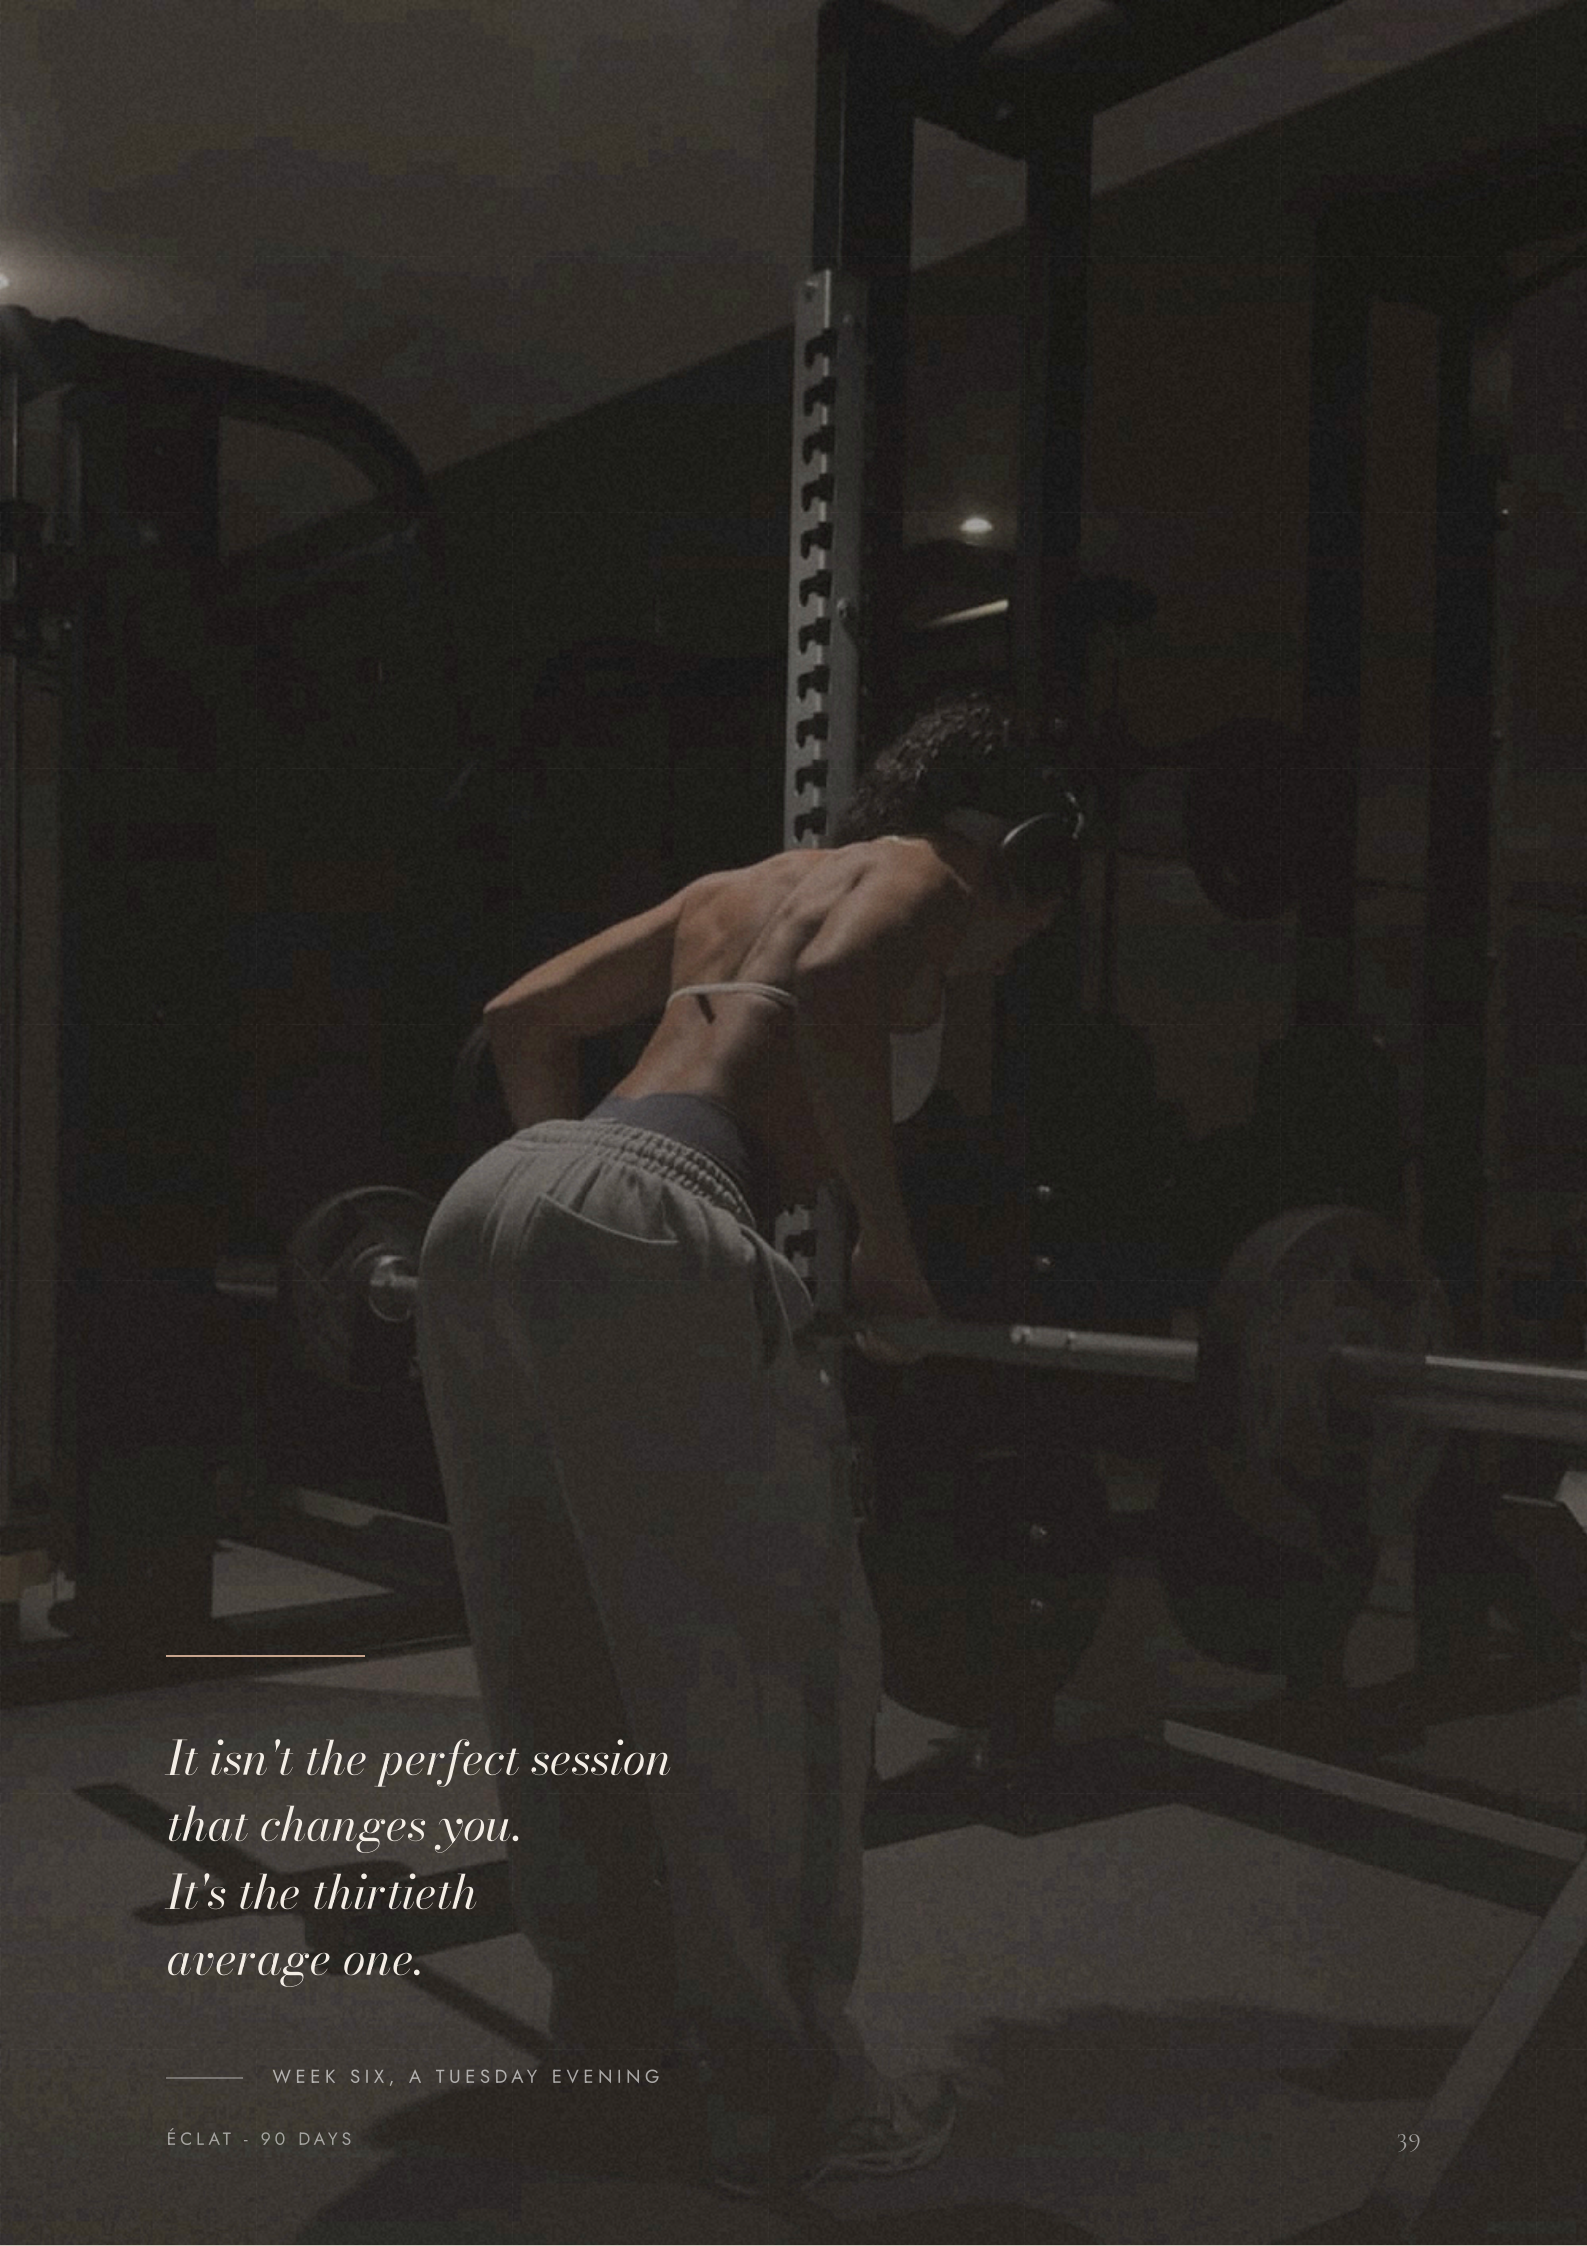

Redo the 12 weeks with the loads you reached as your new starting point. It's the most effective option, and by far the most common among the women who keep going for years.

Keep block 3 on a loop changing every other exercise every two months, if the routine suits you.

Move on to something else - a sport, a class, running. You'll arrive with a base of strength you didn't have three months ago, and that changes everything.

THE ONLY NUMBER THAT REALLY COUNTS

At the end of the 90 days, look at the number of sessions done, not the loads. **Thirty strength sessions out of the thirty-six planned** is a successful programme. A clean sheet doesn't exist, and aiming for one is the surest way to stop altogether in week 7.

It isn't the perfect session that changes you. It's the thirtieth average one.

WEEK SIX, A TUESDAY EVENING

04

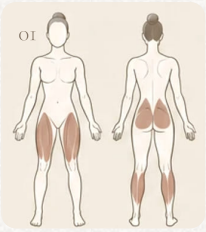

Exercise library

Thirty-five movements, and for each one the only thing that really matters: how to do it cleanly, and what you must not do.

- Lower body - ten cards
- Upper body - ten cards
- Core - five cards
- The circuit - five cards
- Prevention & balance - five cards
- Every card: start, movement, common mistake

The lower body

The five movements that build the legs and glutes

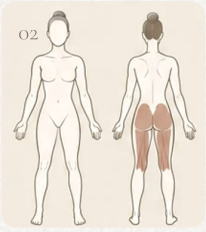

Goblet squat

QUADS · GLUTES · CORE

Start - Feet shoulder-width apart, toes turned very slightly out. Load held tight to the chest, elbows tucked in. **Movement -** Sit down and slightly back, chest tall, until your thighs are parallel to the floor. Come up by driving through your heels.

The common mistake - Knees caving inwards. Think about "spreading the floor" with your feet all the way down.

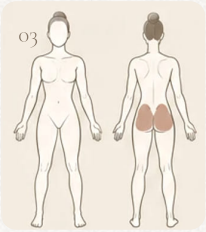

Romanian deadlift

HAMSTRINGS · GLUTES · BACK

Start - Standing, feet hip-width apart, knees very slightly bent and staying that way. Load in front of your thighs. **Movement -** Push your hips back keeping your back perfectly flat. The load brushes your legs. Go down until you feel the hamstrings stretch, then come back up squeezing the glutes.

The common mistake - Rounding the lower back, or bending the knees as in a squat. This isn't a descent: it's the hips travelling backwards.

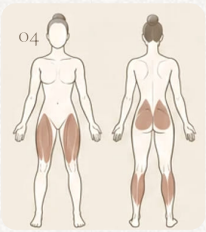

Glute bridge · Hip thrust

GLUTES · HAMSTRINGS

Start - Lying on your back, knees bent, feet flat 30 cm from your hips. Advanced version: shoulder blades resting on a sofa. **Movement -** Lift your hips squeezing the glutes hard, until shoulders, hips and knees are in line. One-second pause at the top, then lower without resting all the way down.

The common mistake - Arching the lower back to get higher. Keep your ribs down: it's the glutes that lift the pelvis, not the lower back.

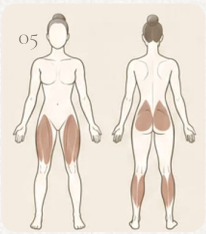

Reverse lunge

QUADS · GLUTES · BALANCE

Start - Standing, feet together, torso upright, eyes ahead. One hand on a wall if balance is short. **Movement -** Take a long step back and lower the rear knee toward the floor without touching it. The front knee stays over the ankle. Push through the front heel to return.

The common mistake - Too short a step, which puts all the load on the front knee. If you feel any knee discomfort, lengthen the step.

Bulgarian split squat

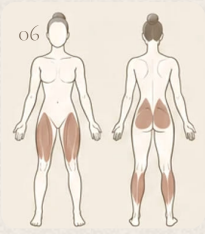

GLUTES · QUADS · STABILITY

Start - Toes of the back foot resting on a chair, front foot a long step ahead. Torso leaning slightly forward. **Movement -** Lower straight down, rear knee toward the floor. All the weight stays in the front heel. Come up without locking the knee.

The common mistake - Pushing off the back leg. It's only there for balance - if you feel it working, move your front foot further forward.

The lower body

Single-leg, hips and calves

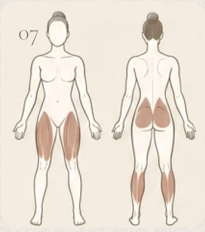

Walking lunges

QUADS · GLUTES · CARDIO

Start - Standing, with a hallway or a room 5 to 6 metres long ahead of you. Weights by your sides if you have them. **Movement -** Take a long step forward, lower the rear knee toward the floor, then go straight into the next step without standing up in between.

The common mistake - Leaning forward as you push off. Keep your torso vertical and your shoulders over your hips.

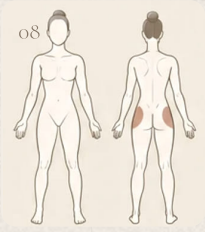

Step-up

GLUTES · QUADS

Start - In front of a stair or a stable bench, roughly knee height. **Movement -** Place one whole foot on the step and rise using that leg only. Lower slowly, controlling the descent over 2 seconds.

The common mistake - Pushing off with the bottom leg. If you have to push with the foot on the floor, the step is too high.

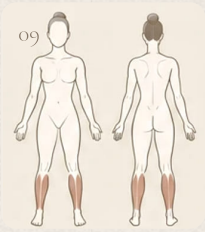

Banded hip abduction

GLUTE MEDIUS · HIPS

Start - Loop band placed just above the knees. Seated on a chair, or lying on your side. **Movement -** Push the knees apart against the resistance, 2 seconds at full opening, then return slowly without releasing the tension completely.

The common mistake - Going too fast. It's a small muscle: the quality of the contraction matters more than the range.

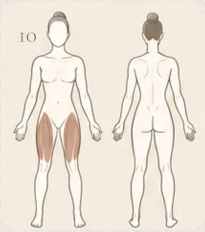

Standing calf raise

CALVES · ANKLES

Start - Balls of the feet on the edge of a step, heels hanging free. One hand resting for balance. **Movement -** Rise as high as you can onto your toes, pause for a second, then drop your heels below the level of the step for a full stretch.

The common mistake - Doing small quick bounces. The full range, top and bottom, does all the work.

Wall sit

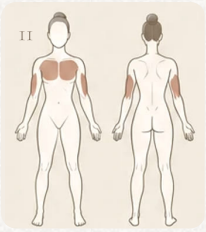

QUADS · MINDSET

Start - Back flat against a wall, feet about 50 cm forward, hip-width apart. **Movement -** Slide down the wall until your thighs are parallel to the floor, knees at 90°. Hold the position, breathing normally.

The common mistake - Resting your hands on your thighs to take the load off. Arms crossed or by your sides - and count the seconds.

The upper body

Pushing, pulling, and standing tall

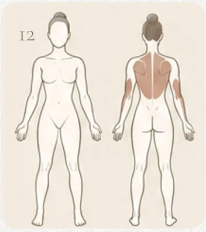

Push-ups

CHEST · SHOULDERS · TRICEPS

Start - Hands slightly wider than your shoulders. Progression from easiest to hardest: hands on a wall → on a counter → on a chair → knees down → feet down. **Movement -** Lower keeping your body perfectly in line, elbows at 45° to your torso. Almost touch the surface, then press back up.

The common mistake - Hips sagging or riding up. Squeeze your glutes and your core: the body has to stay a plank from start to finish.

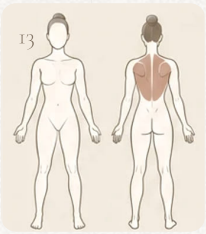

Band row

BACK · BICEPS · POSTURE

Start - Seated on the floor, legs straight, band around your feet or a table leg, one end in each hand. **Movement -** Pull your elbows back along your sides, squeezing the shoulder blades at the end of the movement. Return slowly, under control.

The common mistake - Letting the shoulders rise toward your ears. Think "shoulders down, elbows to the hips".

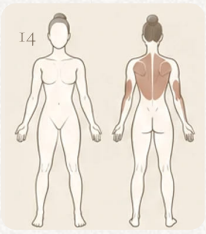

Single-arm row

BACK · CORE

Start - One knee and one hand resting on a chair or a bench, back flat and parallel to the floor. Load in the free hand, arm straight. **Movement -** Pull the load toward your hip keeping the elbow close to your body. The torso doesn't rotate. Lower under control over 2 seconds.

The common mistake - Twisting the torso to pull heavier. If your shoulders don't stay parallel to the floor, the load is too heavy.

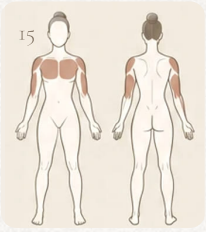

Lat pulldown

BACK · BICEPS

Start - Kneeling under a band anchored at the top of a closed door, arms straight overhead. In the gym: cable pulldown. **Movement -** Pull your elbows down and back, chest open, until your hands reach chin height.

The common mistake - Leaning far back to compensate. Keep your torso almost vertical and reduce the resistance if you need to.

Shoulder press

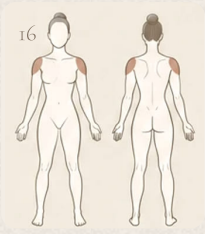

SHOULDERS · TRICEPS · CORE

Start - Standing or seated, weights at ear height, elbows under your wrists, core tight. **Movement -** Press up until your arms are straight without locking the elbows. Lower back to ear height.

The common mistake - Arching the lower back as you press. Brace your abs and glutes: the press starts from the trunk, not the lower back.

The upper body

Arms, shoulders and combined movements

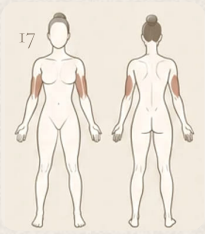

Lateral raises

SHOULDERS

Start - Standing, light weights by your sides, elbows very slightly bent. **Movement -** Raise your arms out to the sides up to shoulder height, no higher. Lower over 3 seconds.

The common mistake - Going too heavy and heaving with the back. This is the exercise where the lightest weight gives the best result.

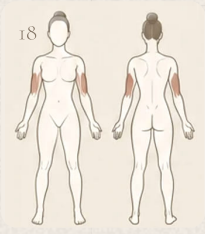

Biceps curl

BICEPS

Start - Standing, weights held underhand (palms forward), elbows tight to the body. **Movement -** Curl the weights toward your shoulders without moving your elbows, then lower slowly to full extension.

The common mistake - Swinging the torso to launch the weight. If you have to use your back, drop a level of load.

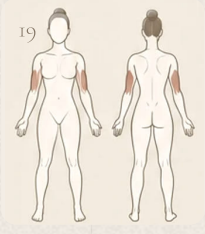

Chair dips

TRICEPS SHOULDERS

Start - Hands on the edge of a stable chair behind you, fingers forward. Legs bent (easy) or straight (hard). **Movement -** Lower by bending your elbows backwards, to about 90°. Press back up through your palms.

The common mistake - Going too low, which pulls on the front of the shoulder. Stop at 90° of elbow bend.

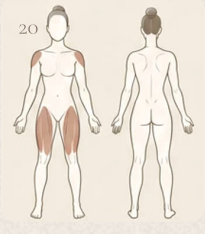

Overhead triceps extension

TRICEPS

Start - One weight held in both hands overhead, arms straight, elbows squeezed forward. **Movement -** Lower the weight behind your head moving only your forearms, then press back to full extension.

The common mistake - Letting the elbows flare. Imagine they're held in a vice pointing forward.

Thruster - squat + press

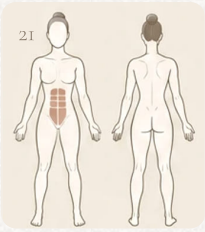

FULL BODY CARDIO

Start - Weights at shoulder height, feet shoulder-width apart. **Movement -** Drop into a full squat, then come up and go straight into an overhead press. The press uses the momentum from your legs.

The common mistake - Separating the two movements. It's one continuous action: coming out of the squat launches the press.

The core

The centre, which holds everything else up

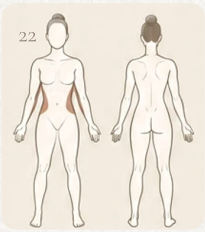

Plank

DEEP CORE · SHOULDERS

Start - On your forearms, elbows under your shoulders, feet hip-width apart. Knees down for the easy version. **Movement -** Squeeze your glutes, tuck your pelvis slightly, and hold while breathing normally. The body forms a straight line from heels to head.

The common mistake - Arching the lower back or lifting your hips. 20 perfect seconds beat 60 saggy ones.

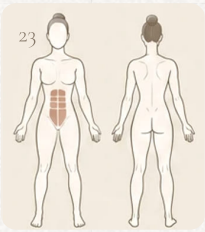

Side plank

OBLIQUES · HIPS

Start - On your side, propped on one forearm, elbow under your shoulder. Legs straight, one on the other, or knees bent. **Movement -** Lift your hips until ankle, hip and shoulder are in line. Hold, then switch sides.

The common mistake - Letting the hips drop little by little. The moment you feel them fall, end the set.

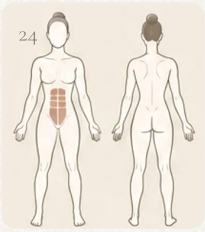

Dead bug

DEEP CORE · COORDINATION

Start - Lying on your back, arms straight toward the ceiling, knees bent at 90° above your hips. Lower back pressed to the floor. **Movement -** Slowly lower one arm and the opposite leg toward the floor, without letting your back lift. Return, then switch sides.

The common mistake - Letting the lower back lift. That's the only criterion: as soon as it lifts, reduce the range.

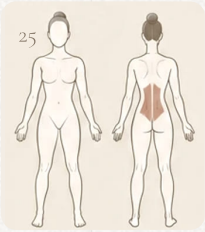

Hollow hold

ABS · CORE

Start - Lying on your back, lower back flat on the floor, arms and legs straight. **Movement -** Lift your shoulders and legs a few centimetres off the floor, the body forming a banana. Hold while keeping your back pressed down.

The common mistake - Straightening the legs too soon. Start with knees bent and arms by your sides, then extend gradually.

Superman

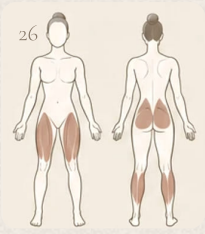

LOWER BACK · GLUTES · POSTURE

Start - Face down, arms straight ahead, legs straight. **Movement -** Lift chest and legs a few centimetres at the same time, eyes toward the floor, 2 seconds at the top, then lower gently.

The common mistake - Lifting the head into neck hyperextension. Your gaze stays on the floor throughout the movement.

The circuit

The fast movements of the C sessions

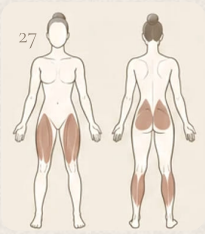

Jump squat

QUADS · GLUTES · CARDIO

Start - Standing, feet shoulder-width apart, arms free. **Movement -** Drop into a squat, then drive hard through your legs to leave the floor. Land on the front of your foot, knees soft, and go again.

The common mistake - Landing with straight legs and heels slapping the floor. The landing should be silent: if it makes a noise, switch to the no-jump version.

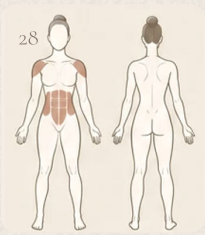

Alternating jump lunge

LEGS · BALANCE · CARDIO

Start - In a lunge position, rear knee close to the floor, torso upright. **Movement -** Jump and switch legs in the air, landing straight into a lunge on the other side, controlling the descent.

The common mistake - Leaning forward and letting the front knee travel far past the ankle. If in doubt, do alternating reverse lunges with no jump.

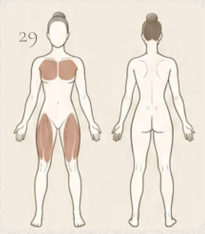

Mountain climbers

ABS · SHOULDERS · CARDIO

Start - In a straight-arm plank, hands under your shoulders, body in line. **Movement -** Draw one knee toward your chest then the other, alternating at a steady rhythm. The hips stay low and stable.

The common mistake - Letting the hips rise with every rep. If that happens, slow down or put your hands on a table.

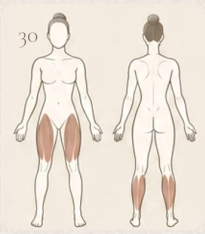

Burpee

FULL BODY · CARDIO

Start - Standing, feet hip-width apart. **Movement -** Hands to the floor, step or hop your feet back into a plank, do a push-up (optional), bring your feet back in, then stand up with a jump. Gentler version: step one foot back after the other, no jump, no push-up.

The common mistake - The back rounding as you bring your feet in. Under fatigue, go back to the step-by-step version rather than letting the position break down.

Brisk walk in zone 2

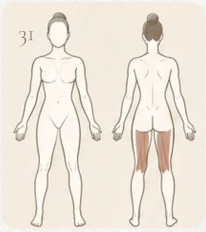

HEART · RECOVERY

Start - Outside if possible, comfortable shoes, 30 to 45 minutes ahead of you. **Movement -** Walk at a pace where you can say a full sentence while out of breath, but not sing. A slight incline is enough to step it up a level.

The common mistake - Trying to turn it into a race. The benefit comes from the time held, not the intensity - and too hard a zone 2 ruins the next day's strength session.

Prevention & balance

The five movements that protect what you're building

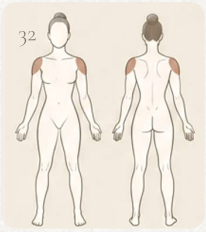

Banded leg curl

HAMSTRINGS · KNEE

Start - Face down, loop band around your ankles, the other end anchored in front of you - a furniture leg or the bottom of a door. **Movement -** Bend your knees to bring your heels toward your hips: 2 seconds up, 3 down. The pelvis stays pressed to the floor.

The common mistake - Lifting the hips to help. If that happens, reduce the tension - this is a small finishing movement, not a strength exercise.

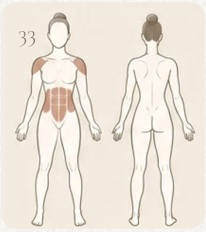

Banded external rotation

ROTATOR CUFF · SHOULDER

Start - Standing, elbow bent to 90° and tight to your side, a rolled towel wedged between elbow and ribs. Band anchored at navel height. **Movement -** Rotate your forearm outwards without letting the elbow leave your side, then return slowly. Modest range, constant tension.

The common mistake - Using too strong a band and compensating with the whole torso. This is the exercise where the lightest protects the best.

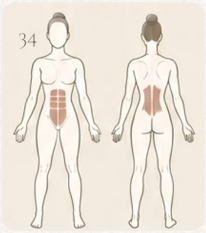

Carry - farmer's walk

CORE · GRIP · POSTURE

Start - A heavy weight in each hand, arms by your sides, shoulders down and back, core tight. **Movement -** Walk 20 even steps, turn around, come back. Breathe normally: above all, don't hold your breath.

The common mistake - Leaning to one side or letting your shoulders round forward. If your posture collapses, put the weights down: the set is over.

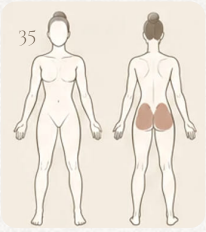

Bird dog

LOWER BACK · ANTI-ROTATION

Start - On all fours, hands under your shoulders, knees under your hips, back flat like a table. **Movement -** Extend one arm and the opposite leg to horizontal at the same time, 2 seconds, then return. The pelvis doesn't tilt.

The common mistake - Letting the pelvis rotate. Balance a bottle on your lower back: it mustn't fall off.

Single-leg glute bridge

GLUTES · PELVIC BALANCE

Start - Lying on your back, one foot on the floor, the other knee drawn toward your chest. **Movement -** Lift your pelvis by pushing through the heel on the floor, without letting the opposite hip drop. One-second pause at the top.

The common mistake - Letting one hip sit lower than the other - that is precisely the imbalance this exercise exists to correct.

PART FIVE

05

Mobility & recovery

Muscle isn't built during the session. It's built in the hours that follow - and only if you give it the chance.

- The morning routine, seven minutes
- The evening routine, ten minutes
- Sleep, hydration, soreness: what actually matters

The two daily routines

Morning

7 MINUTES

To be done before coffee, barefoot, breathing through the nose. The aim isn't to stretch but to **unlock** : putting movement back into joints that haven't moved for eight hours.

Cat-cow *On all fours, arch then round the whole spine*	10 ×
Downward dog, pedalling *Bend one leg then the other to wake the calves*	45 s
Deep squat hold *Heels down if you can, elbows pushing the knees apart*	45 s
Lunge with rotation *One hand on the floor, the other arm reaching for the ceiling*	5 / side
Hip circles on all fours *One knee lifted, drawing wide circles*	8 / side
Shoulder pass-throughs with a towel *Wide grip, arms straight, front to back*	10 ×
Three full breaths, standing *In for 4 through the nose, out for 6 through the mouth*	3 ×

Evening

10 MINUTES

In the half hour before bed, lights low. Here the stretches are **held** : 45 seconds minimum per position, breathing slowly. It's also a signal to the nervous system: the day is over.

Child's pose *Knees apart, arms reaching far forward, forehead down*	60 s
Seated hamstring stretch *One leg straight, back flat, lean forward without rounding*	45 s / side
Low lunge, hip toward the floor *The most useful stretch if you sit all day*	45 s / side
Lying figure four *Ankle on the opposite knee, draw the thighs toward you*	45 s / side
Lying twist *Knees falling to one side, shoulders on the floor*	45 s / side
Legs up the wall *Lying down, hips close to the wall, legs vertical*	2 min
4 - 8 breathing *In for 4, out for 8. Ten cycles, eyes closed*	2 min

IF YOU ONLY KEEP ONE

Keep **the evening one**, and above all its last two lines. Legs up the wall and long breathing: three minutes that improve how fast you fall asleep - and sleep is the number one recovery factor, ahead of everything else.

Recovering properly

Sleep

This is the number one lever, by a distance. Below 7 hours regularly, muscle building slows, hunger rises, and RPE climbs at the same load - you feel like you're going backwards when you're simply short on sleep.

Three adjustments that work: a fixed bedtime to within 20 minutes, no screens in the 30 minutes before, and a bedroom at 18-19 °C. In that order of importance.

Rest days

Two days a week with no session. They aren't wasted days: that's when the body repairs and strengthens what you've worked.

A rest day isn't necessarily a motionless day. Walking, housework, gentle cycling, stretching: anything that isn't a structured session counts as active rest, and actually speeds recovery up.

Soreness

It arrives 12 to 48 hours after the session, not during. Normal for the first two weeks, then far rarer - and its disappearance doesn't mean the session has "stopped working". **It is not a measure of progress.**

Moving is what clears it fastest; the worst thing is to stay still. If the next session targets the same area, drop the load by 20 % rather than cancelling.

Drinking, and spotting real pain

Count on **1.5 to 2 litres a day**, more in the luteal phase and on session days. The marker is simpler than counting glasses: pale urine in the middle of the day. If it's dark, drink more.

And keep a clear line in mind. Soreness is diffuse, it sits in the muscle, it shows up the next day and it fades as you move. **Sharp pain, joint pain, pinpoint pain, or pain radiating down a limb, is not soreness** : you stop the exercise and you get it checked. No amount of progress is worth an injury that drags on for six months.

> THE SIGNS OF OVERTRAINING
>
> Sleep getting worse even though you're training, unusual irritability, motivation in free fall, performance dropping three sessions running, a higher resting heart rate in the morning. Any two of these together: take a deload week immediately. That isn't a step back, it's the repair.

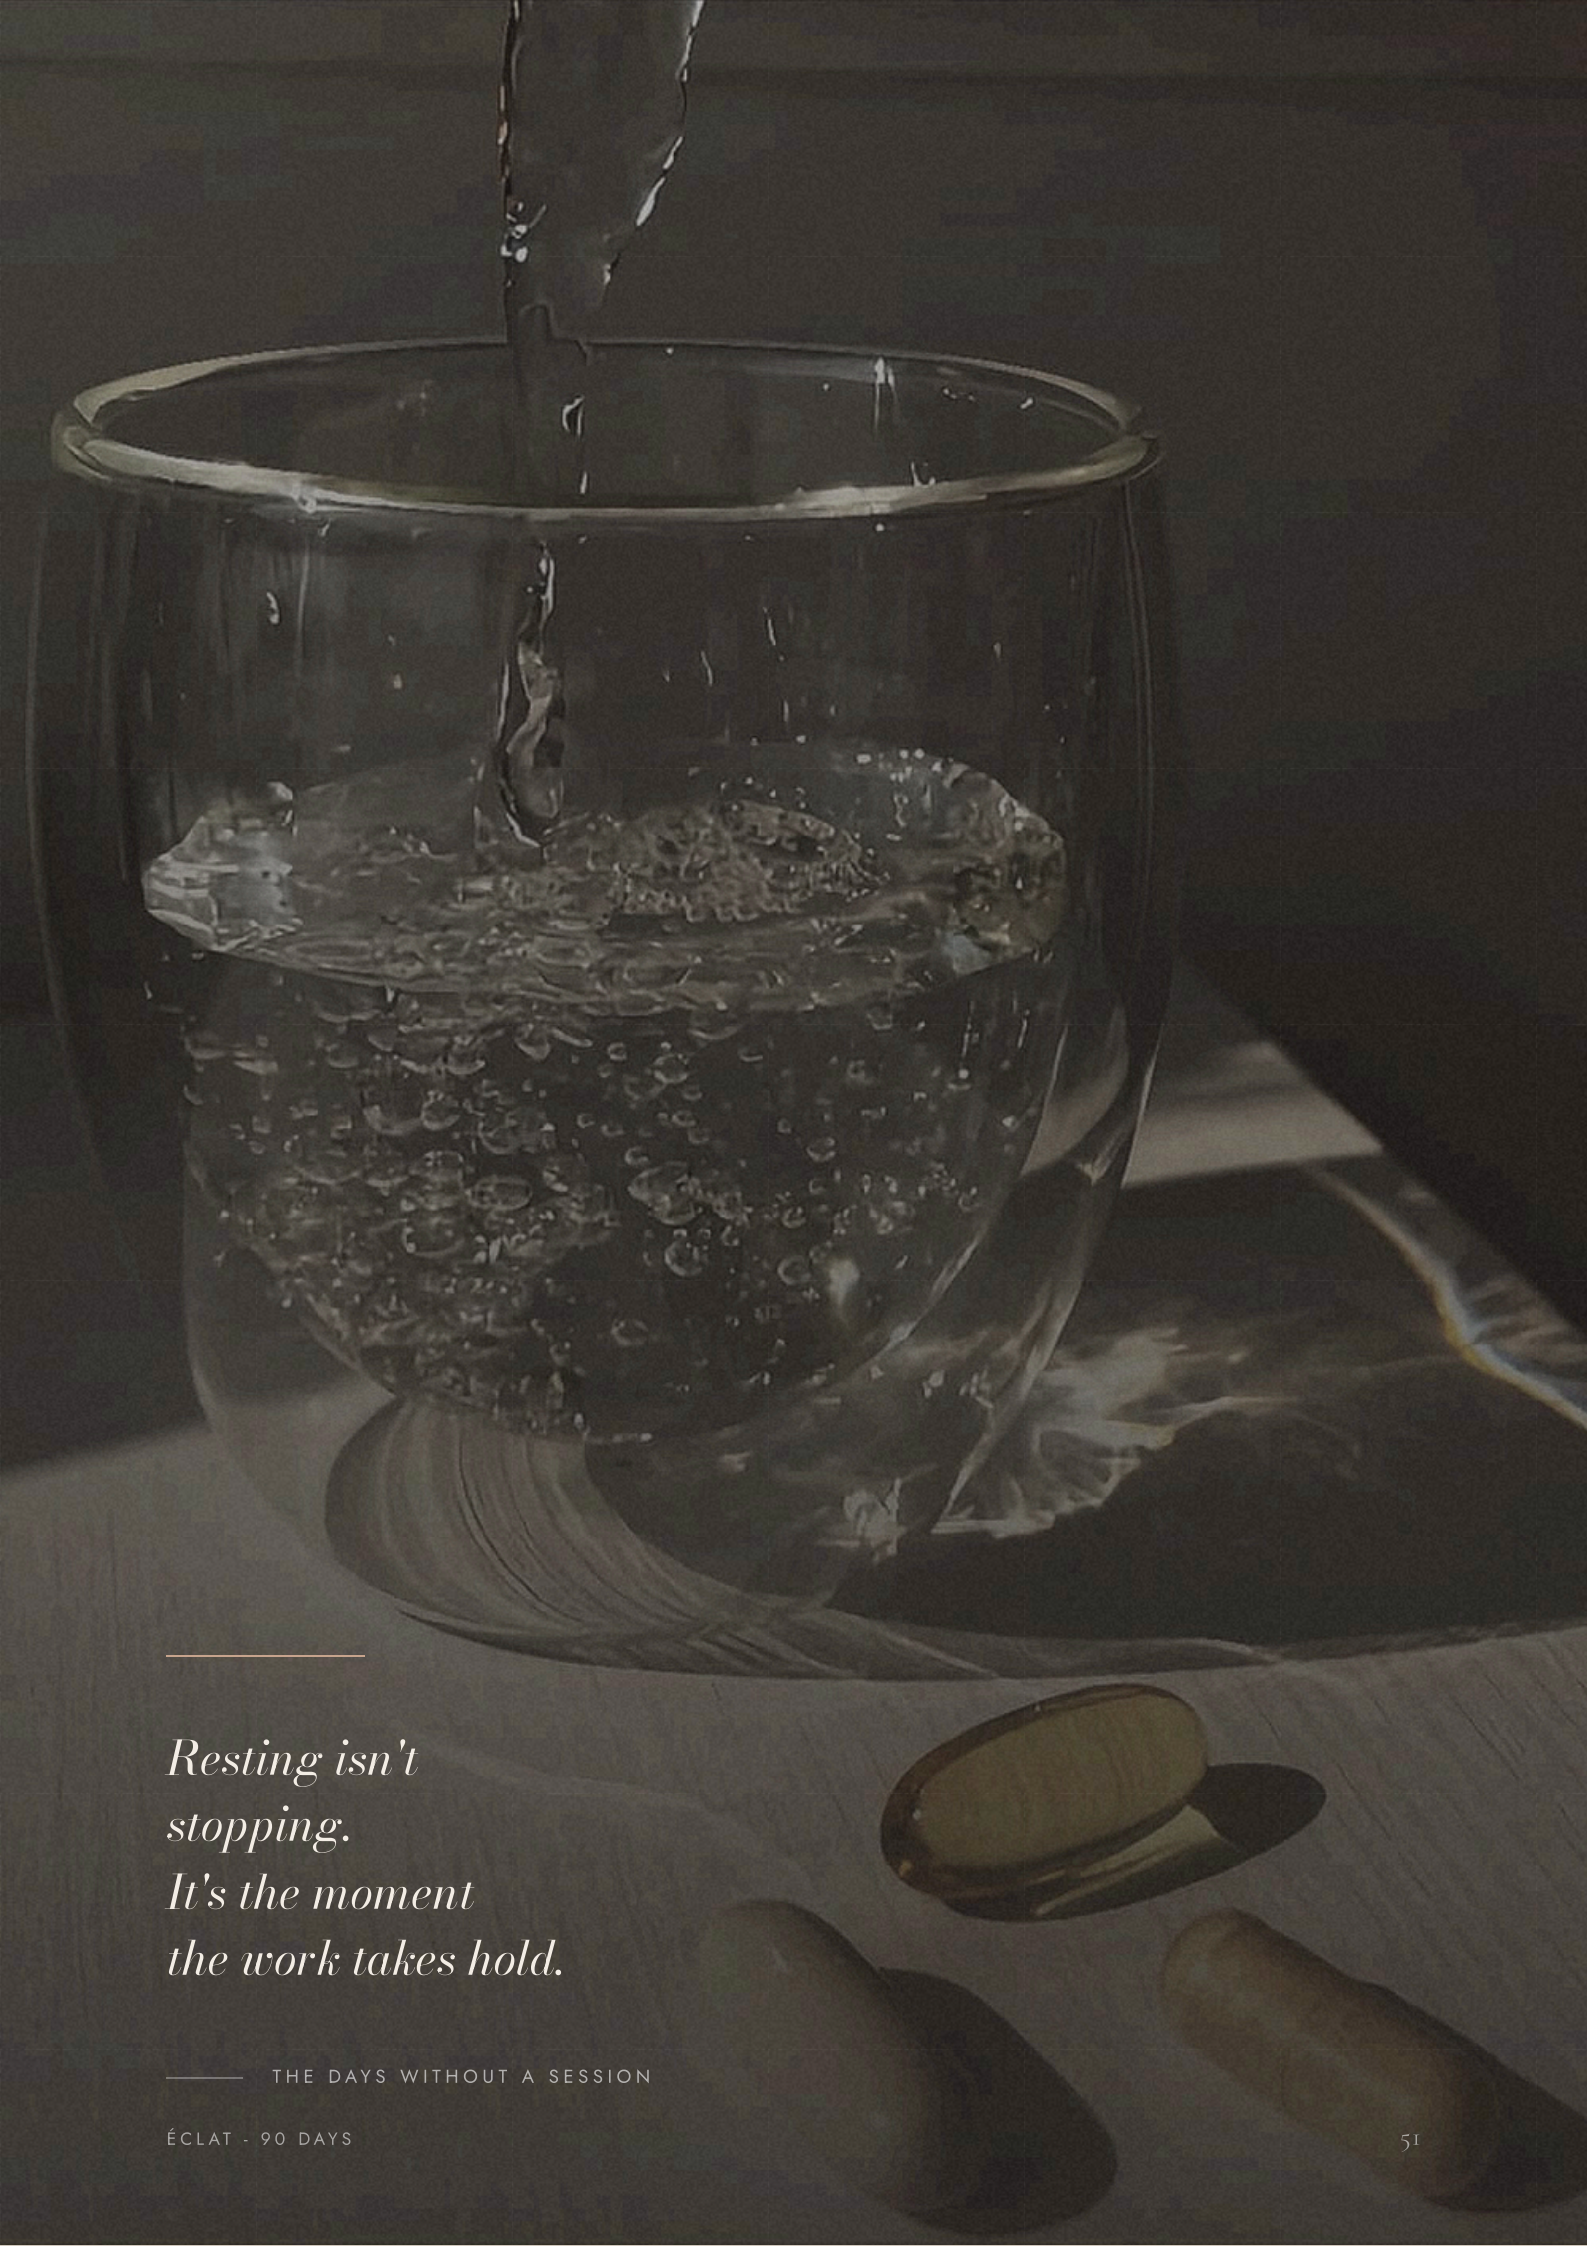

THE THREE NUTRITION RULES OF THIS GUIDE

The subject will have a volume of its own. For these 90 days, three markers are enough.

1 · Protein at every meal. Aim for **1.6 g per kilo of bodyweight per day** - for 60 kg (around 9 st 6), roughly 96 g, which is four palm-sized portions: eggs, Greek yoghurt, cottage cheese, fish, poultry, pulses, tofu. Without it, the muscle you stimulate doesn't rebuild and you do the work without collecting the result.

2 · Eat at maintenance, or barely below. A shape that changes in 90 days means not eating more than you spend. But an aggressive deficit melts muscle along with everything else, destroys the energy of your sessions, and doesn't last three months. **300 kcal below, no more.**

3 · Drink during the session. A mouthful between sets, around 500 ml over an hour. Even mild dehydration drops your strength and lengthens recovery.

Resting isn't
stopping.
It's the moment
the work takes hold.

THE DAYS WITHOUT A SESSION

PART SIX

06

Lasting 90 days

The programme isn't the hard part. The hard part is still opening it on the Tuesday of week seven.

- The two walls, and how you get past them
- The two-day rule and the bare minimum
- The ritual that makes a session automatic
- Resuming, rather than catching up

The two walls

Almost every drop-out happens at two precise moments. Knowing them doesn't make them easier - but it changes everything to know they were expected.

The week 3 wall

THE BOREDOM WALL

The excitement of the start has worn off. The soreness has gone - which you read as "it isn't doing anything any more". And nothing has changed in the mirror, because three weeks is far too early.

What gets you past it: looking at your load table, not your reflection. You have almost certainly increased something since week 1 - that is what progress looks like at this stage. And week 4 is a deload: only three hard sessions left.

The week 7 wall

THE FATIGUE WALL

Volume is at its peak, novelty is long gone, and the end is still far away. It's the hardest stretch of the 90 days, and it is **normal** to stop wanting to.

What gets you past it: reread the sentence you wrote on page 10. Lower the demand without lowering the frequency - three lighter sessions beat a blank week. And remember that week 8 is a deload, followed by the day 60 review.

The two-day rule

One skipped session doesn't matter at all. Two in a row is the beginning of stopping. Hence the only thing to remember from this part: **you never miss twice in a row.** The quality of the second one doesn't matter - it can last ten minutes, it just has to exist.

The bare minimum

For the days when everything falls apart, there's a ten-minute emergency session that counts as a real one:

3 rounds of: 15 squats · 10 push-ups (at your level) · 15 glute bridges · 30 seconds of plank. No rest between exercises, 1 minute between rounds.

It won't make you progress. It will do something more important: it will stop you from stopping.

Resume, don't catch up

You've missed three sessions and the temptation is to do four the following week. **Don't** : that's the surest way to injure yourself and to confirm that you "can't do it". Pick up where you left off, 10 % less load on the first session. The programme stretches by a week - nobody is timing you.

Making the session automatic

Willpower is a limited resource, and by 7 pm it is almost spent. Relying on it to train is losing every time. What works instead is cutting the number of decisions between walking through the door and starting.

Every decision is a chance to give up: *am I training today? which session? where are my leggings? what music?* Four decisions, four exits. The ritual consists of removing all of them in advance.

THE RITUAL IN FIVE POINTS

01 **A fixed day and time**
In the calendar, with a reminder. Not "this week", but "Tuesday 6.30 - 7.15 pm".

02 **Clothes out the night before**
Left in plain sight. It's the most effective move in the ritual, and the most underrated.

03 **One single playlist**
Always the same one, kept for sessions. After three weeks the first few notes trigger the urge on their own.

04 **The page open in advance**
The guide open at the right session, the bottle filled, the mat unrolled. Before you've even decided to start.

05 **Phone out of sight**
On airplane mode or in another room - unless it's your timer. A 40-minute session broken up by notifications takes 70.

THE TWO-MINUTE RULE

On the days you really don't feel like it, the commitment isn't "do the session". It is: **put the clothes on and do the warm-up.** Two minutes. If you want to stop after the warm-up, you stop, guilt-free - it's a sincere contract. In practice you'll carry on nine times out of ten: the hard part isn't the session, it's starting.

HABIT STACKING

Attach the new habit to one that's already solid: *"after I put my bag down when I get home, I change into my kit"*, *"after brushing my teeth in the morning, I do the seven minutes of mobility"*. An old habit becomes the trigger for the new one, and you no longer have to remember it.

SO WHAT ABOUT MOTIVATION?

It comes back, but not from where you expect. It doesn't precede action: it follows it. Watching the ticked boxes pile up on your tracker, writing down a heavier load, catching yourself climbing stairs without puffing - that's where the desire returns. **Action first, motivation second.** Always in that order.

ONE LAST PIECE OF ADVICE

Tell one person that you've started, and give them your day 90® date. Not so they can police you - so that the commitment exists outside your own head. That is the measurable difference between the women who finish and those who quietly stop.

When life gets in the way

Over twelve weeks there will inevitably be a trip away, a sore throat, an impossible week at work. A programme that doesn't plan for that is a programme designed to fail. Here is the answer to each case - decided in advance, not in the heat of the moment.

I'm away for a few days

Pack a resistance band: it weighs 80 grams and replaces half the programme. Do **session C** from your current block, which needs almost nothing, and walk. Three days without strength work costs you nothing; it's the complete break in routine that's expensive.

I'm ill

The neck rule: if the symptoms are **above it** (runny nose, sore throat), a lighter session is possible. If they're **below it** - fever, chesty cough, aching all over, breathlessness - you don't train, full stop. Come back at 70 % of your loads for two sessions.

I'm on my period and in pain

Nothing obliges you to train. If you feel up to it, movement often eases the cramps: keep the session but drop the load by 20 % and swap the core work for a walk. If you don't feel up to it, it's a rest day - you'll make it up naturally.

I only have twenty minutes

Do the **first three exercises** of the planned session, in order, without the finisher. They're always the most important ones: that's exactly why they come first.

The gym is packed

Don't queue for a machine: take the home version of that line, written just below it in the table. Or reorder the exercises - except the first, which stays first.

I have no equipment today

Every session works with bodyweight. To make up for the missing load, use a **3-1-1 tempo** : three seconds down, one pause, one second up. A bodyweight squat done that way is harder than a loaded squat done sloppily.

I've stopped for two weeks or more

You restart **at the beginning of the current block**, not where you left off, and with 20 % less load for the first week. You'll be back to your level within two sessions: strength returns much faster than it is built.

SOMETHING HURTS

Discomfort that disappears once you're warm: you can carry on while keeping an eye on it. Pain that grows during the set, that is sharp, in a joint, or radiating down a limb: **you stop the exercise**, you replace it with a movement from the same family that doesn't hurt, and if it lasts more than a week, you get it checked.

Never "push through" joint pain. It is the only piece of advice in this guide with no exception.

THE PRINCIPLE BEHIND ALL OF THESE

In every situation, the answer is never "I cancel". It is "I reduce". Cut the volume, the load, the duration - all of it is allowed. What breaks a programme isn't a week at 60 %: it's a week at zero, because it calls for the next one.

The questions I get asked

“I haven't lost weight after a month.”

This is common and it isn't a failure. You're building muscle while losing fat: the scale barely moves, the mirror and your clothes do. Look at your waist and your loads, not the morning number. If after six weeks nothing has moved *anywhere*, the problem is on the plate, not in the programme.

“How long before I see a result?”

Energy and sleep: two to three weeks. Strength: three to four. Clothes fitting differently: six to eight. Side-by-side photos with no ambiguity: ten to twelve. Anyone promising faster is selling you something.

“Do I need protein powder?”

No. It's a convenient food, not a magic supplement: if you hit your 1.6 g per kilo with eggs and cottage cheese, it adds nothing. It helps on the days when that's impossible.

“What about creatine?”

It's the most studied supplement in the world, safe and effective in women too. But it comes after sleep, protein and consistency - which means not during these 90 days. Put your energy into the first three.

“Can I run as well?”

Yes, once or twice a week, keeping run days away from leg sessions. Beyond that, running eats the recovery strength needs and both progress more slowly. The cardio session in the programme can perfectly well *be* your run.

“Does fasted cardio burn more?”

No. At equal expenditure across the day, the difference is negligible. If training fasted suits you, do it; if it leaves you with no legs, eat first. It's a question of comfort, not effectiveness.

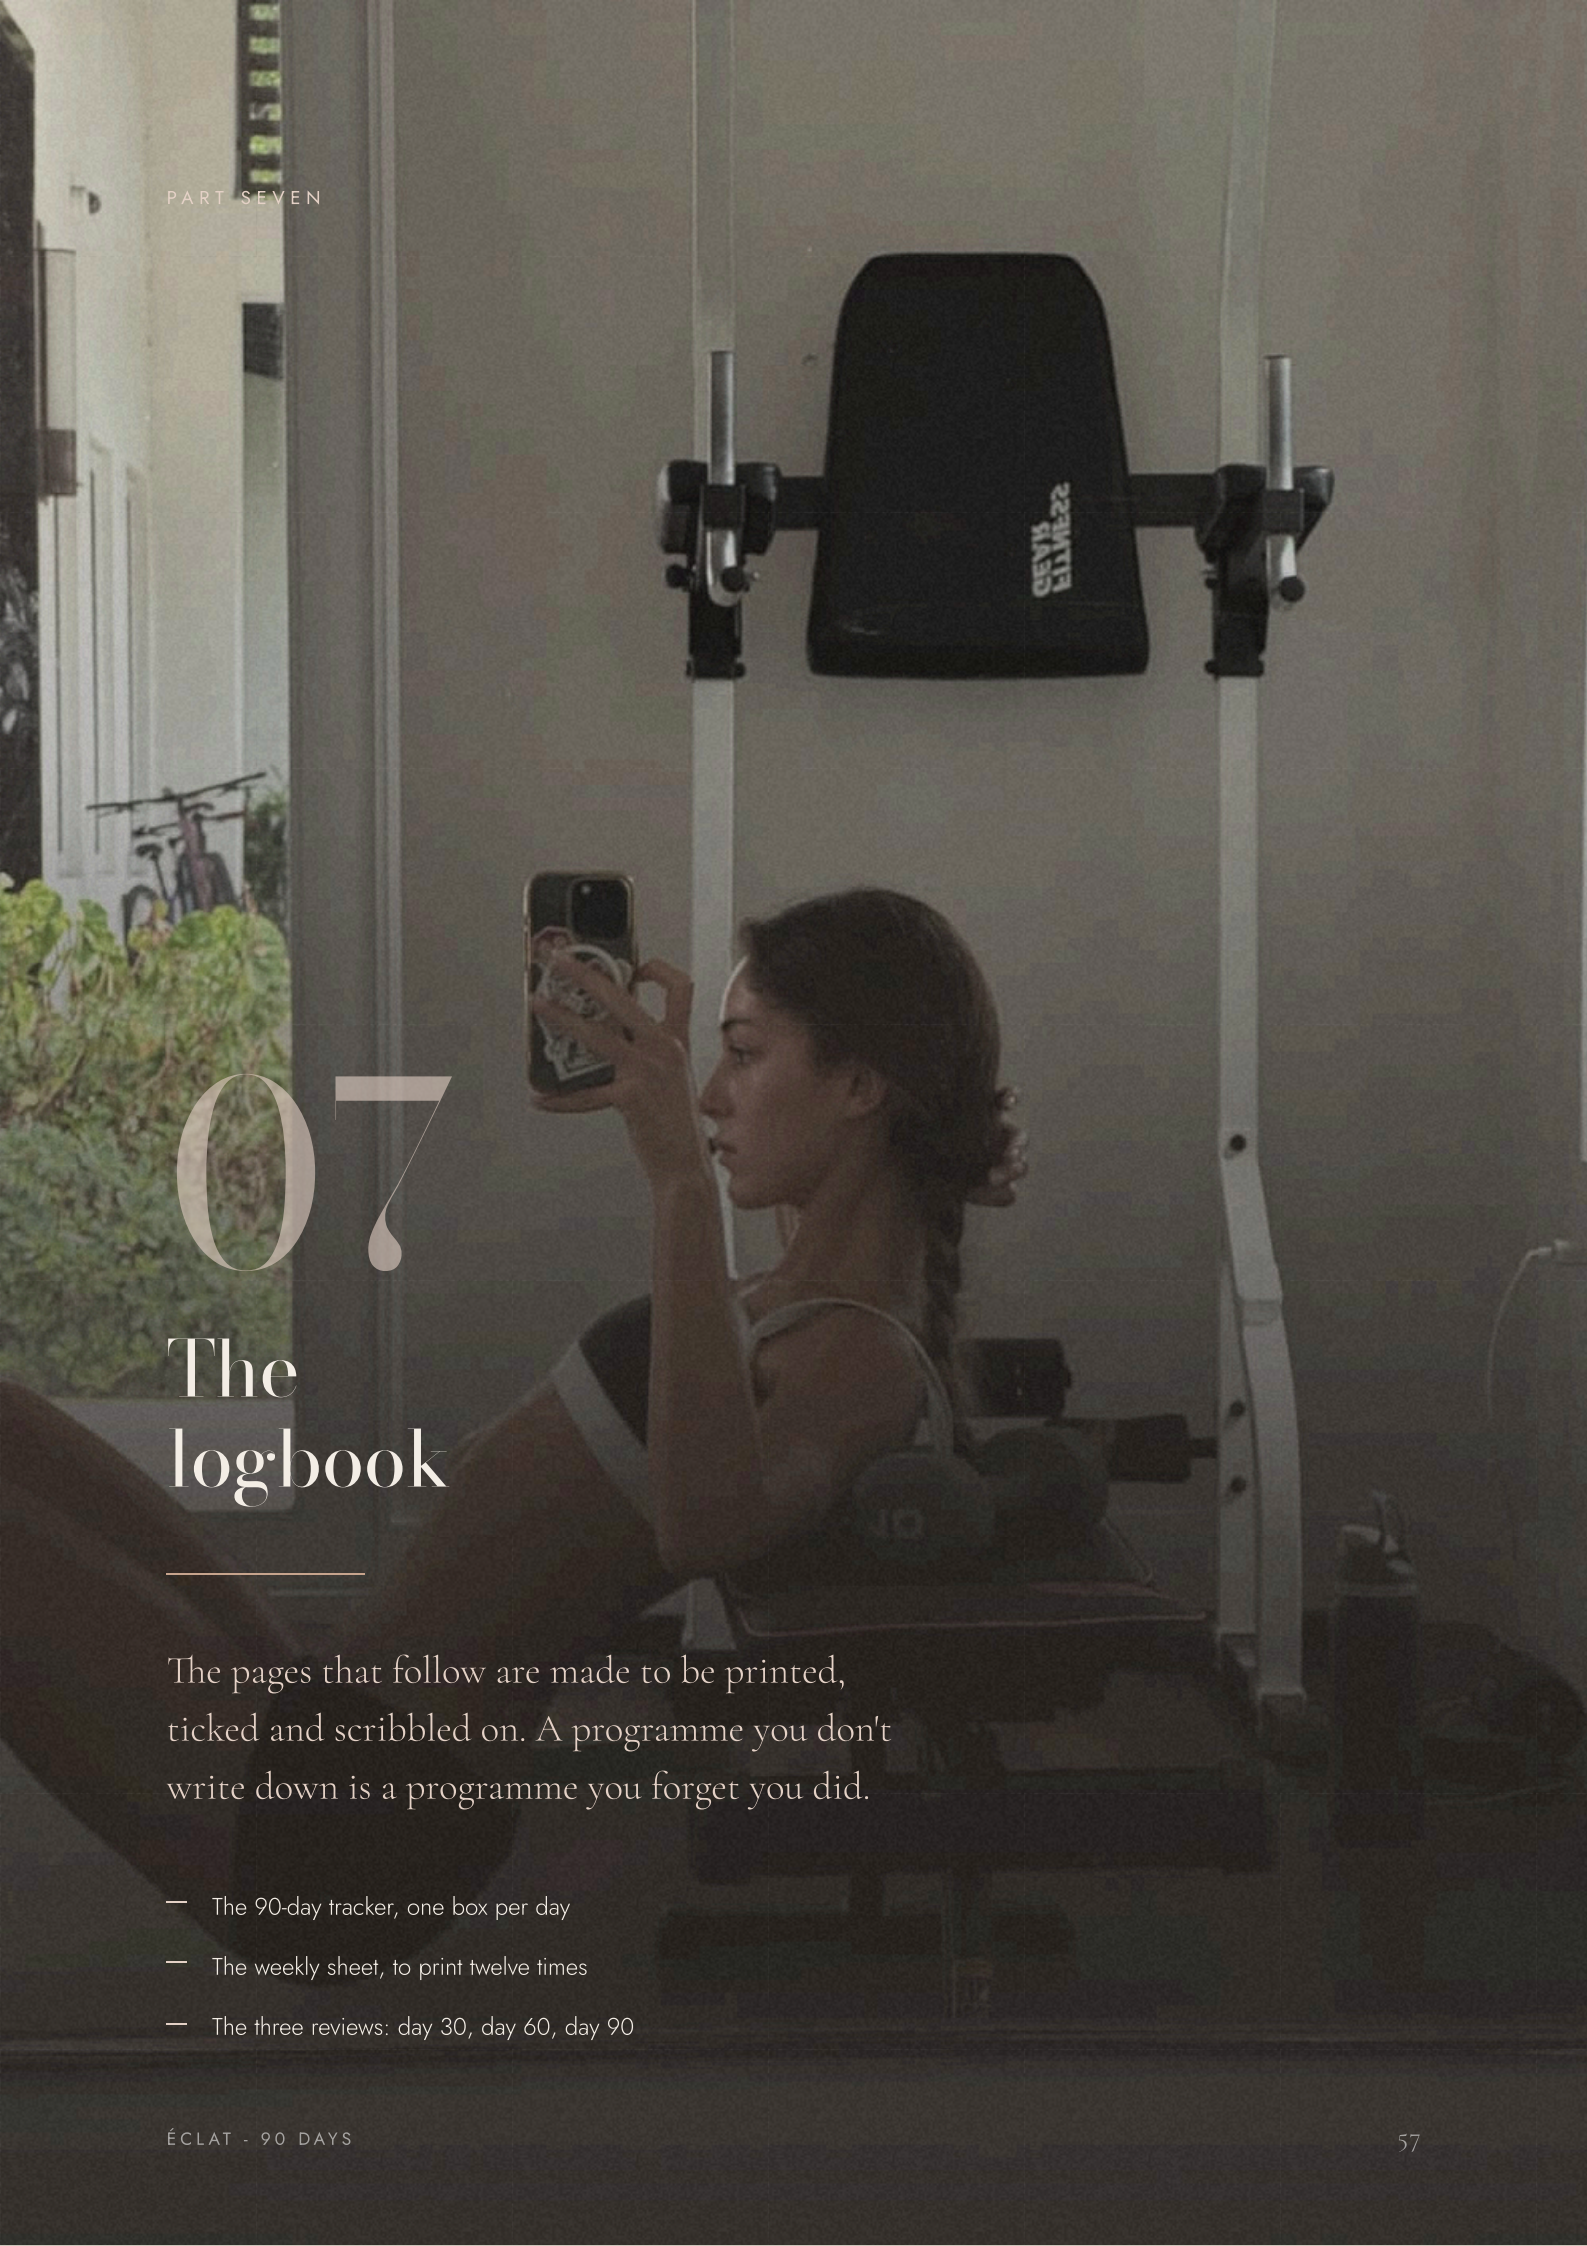

“I can't do a single push-up.”

That's the starting point for most women, because a floor push-up means pressing about 65 % of your bodyweight. The progression by hand height exists for exactly this: lower it by a few centimetres every two weeks. Many get there between week nine and week twelve.

“I feel heavier after two weeks.”

Normal. A working muscle stores water and glycogen, and the scale can rise by one or two kilos in the first weeks. It isn't fat, it goes away, and it's actually the sign that your body is responding.

> **A QUESTION THAT ISN'T HERE?**
>
> The answer is almost always one of three: sleep more, eat more protein, or be more consistent. Those three levers explain the overwhelming majority of plateaus - long before the choice of exercises or the time of day you train.

07

The logbook

The pages that follow are made to be printed, ticked and scribbled on. A programme you don't write down is a programme you forget you did.

- The 90-day tracker, one box per day
- The weekly sheet, to print twelve times
- The three reviews: day 30, day 60, day 90

LOGBOOK · TO TICK

The 90 days

One box per day. You tick it as soon as the session is done - even the ten-minute version. The tinted columns are the three suggested strength sessions; the cardio session goes wherever you like in the week.

	MON	TUE	WED	THU	FRI	SAT	SUN

THE SUCCESS THRESHOLD

Thirty strength sessions out of thirty-six, i.e. 83 %, is an excellent result - better than the vast majority of fitness programmes that are seen through to the end. Don't aim for a perfect grid: aim for a finished one.

WHAT CHANGED MOST, AND THAT I WASN'T EXPECTING

WHAT COST ME THE MOST THIS MONTH

ONE THING I'M CHANGING FOR BLOCK 2

BEFORE YOU TURN THE PAGE

If your numbers have barely moved but you've done at least eight sessions out of twelve, you are exactly where you should be. The first month builds the habit; the second is the one that builds the body.

Day 60 review

Two thirds of the way. This is the most satisfying of the three reviews: the loads have clearly gone up, and the changes are starting to show in the compared photos.

THE SEVEN MARKERS - FROM 1 TO 10

Energy on waking	1	2	3	4	5	6	7	8	9	10
Sleep quality	1	2	3	4	5	6	7	8	9	10
Feeling of strength	1	2	3	4	5	6	7	8	9	10

WHAT I CAN DO TODAY THAT I COULDN'T DO ON DAY 0

WHAT I'M PROUDEST OF

WHAT I NEED TO GET THROUGH THE LAST MONTH

BEFORE YOU TURN THE PAGE

Get your day 0 photos out and compare them with today's, same light, same outfit. This is the point where the difference becomes undeniable - and where you need to look at it, because it will carry the last four weeks.

Day 90 review

You're here. Fill this page in slowly, and compare it with the two previous ones and with your day 0 page. Everything you've written over three months comes together here.

THE SEVEN MARKERS - FROM 1 TO 10

Energy on waking	1	2	3	4	5	6	7	8	9	10
Sleep quality	1	2	3	4	5	6	7	8	9	10

MY THREE ORIGINAL GOALS - WHERE I ACTUALLY STAND

WHAT HAS CHANGED AND CAN'T BE MEASURED

WHAT I DO FROM TOMORROW

> **BEFORE YOU TURN THE PAGE**
>
> Whatever the numbers say, you have done something most people don't: you kept a promise to yourself for ninety days. That is exactly where confidence comes from - not from the mirror.

DAY 90

What you take with you

Ninety days ago you signed a page half expecting not to get there. That's what a sincere commitment is: you make it without knowing.

You probably didn't complete all thirty-six strength sessions. Nobody does. You may have lost a whole week, come back lighter, missed the Tuesday of week seven. And here you are.

What you take with you isn't in the numbers on the previous page, even though they moved. It's somewhere else, and it's harder to measure: you now know, concretely, that you can hold on to something over time. Not because someone told you. Because you've just done it.

That's where the confidence mentioned on the very first page comes from. Not from a transformed body - from a promise kept to yourself, thirty times in a row, including on the days when nobody was watching.

You didn't repair something broken. You came back to live in your own body.

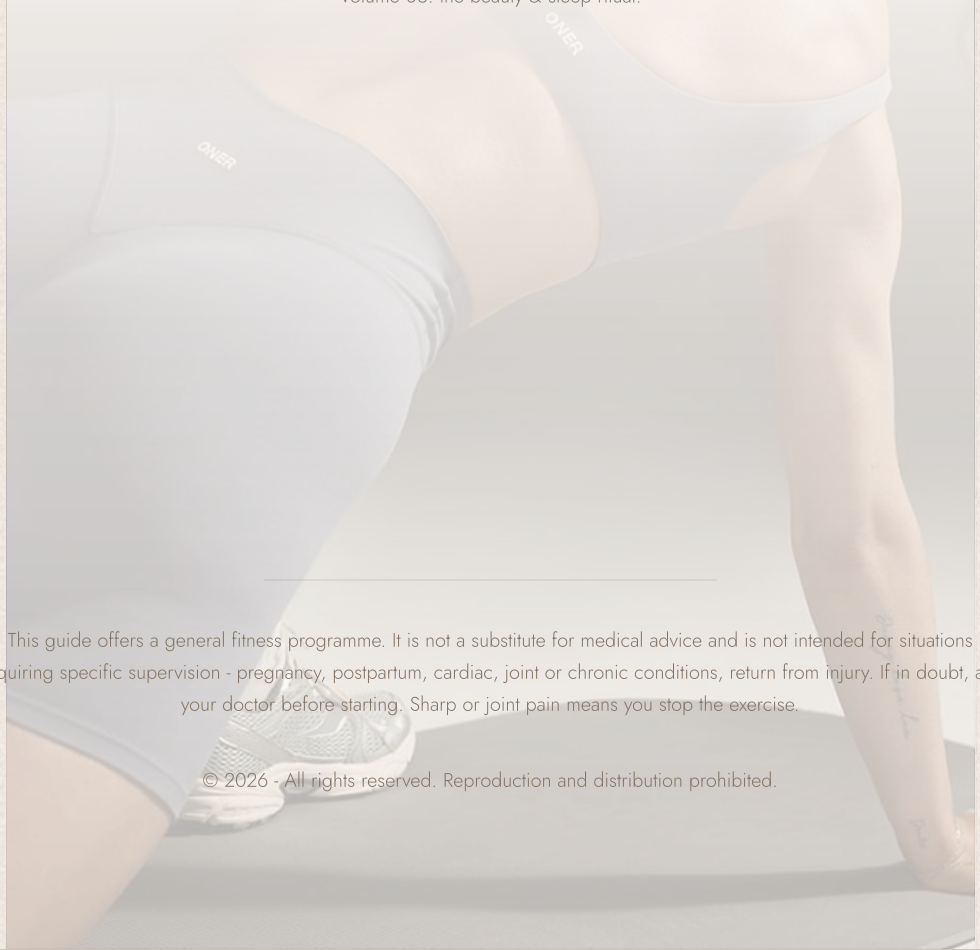

AND TOMORROW?

Start the programme again at block 1, with today's loads as your new baseline, or carry on with block 3 and swap out every other exercise. Above all: keep the appointment. Three slots a week in a calendar is all that separates a three-month parenthesis from a life that changed.

Volume 01 · The Movement Guide
The 90-day challenge

Coming next - Volume 02: the plate.
Volume 03: the beauty & sleep ritual.

This guide offers a general fitness programme. It is not a substitute for medical advice and is not intended for situations requiring specific supervision - pregnancy, postpartum, cardiac, joint or chronic conditions, return from injury. If in doubt, ask your doctor before starting. Sharp or joint pain means you stop the exercise.
